# Introduction

This codebook provides documentation for the 2020 National Survey on Drug Use and Health (NSDUH) public use data file. NSDUH is sponsored by the Center for Behavioral Health Statistics and Quality within the Substance Abuse and Mental Health Services Administration (SAMHSA) and is conducted by RTI International, Research Triangle Park, North Carolina.<sup>1</sup>

## 1. NSDUH Overview

The primary purpose of NSDUH is to measure the prevalence and correlates of substance use and mental health issues in the United States. The survey started in 1971 and was conducted periodically until 1990 when it became an annual survey. Since 1991, the target population has been the civilian, noninstitutionalized population of the United States aged 12 or older at the time of the survey. Currently, public use files (PUFs) are available for surveys from 1979 onward.

Since 1971, NSDUH has undergone many changes. The most notable changes and the impacts of those changes are listed below:

- 1999
  - The survey sample switched from a national sample design to a 50-state design with an independent, multistage area probability sample for each of the 50 states and the District of Columbia.
  - The method of data collection changed from a paper questionnaire administration to computer-assisted interviewing (CAI), using a combination of computer-assisted personal interviewing (CAPI) conducted by field interviewers (FIs) and audio computer-assisted self-interviewing (ACASI).
  - Due to these changes, only limited comparisons can be made between data from the redesigned surveys starting in 1999 and onward and data obtained from surveys prior to 1999.
- 2002
  - The survey's name was changed from the National Household Survey on Drug Abuse (NHSDA) to the National Survey on Drug Use and Health (NSDUH).
  - Each NSDUH respondent was offered an incentive of \$30, initially resulting in improved survey response rates. In recent years, however, response rates have been declining and were lower in 2020 than in previous years.<sup>2</sup>
  - New population data from the 2000 decennial census became available for use in NSDUH's sample weighting procedures.
  - The 2002 data constituted a new baseline for tracking trends in substance use and other measures. It is not considered appropriate to make comparisons of the 2002

---

<sup>1</sup> RTI International is a registered trademark and a trade name of Research Triangle Institute.

<sup>2</sup> The addition of web-based data collection in Quarter 4, 2020, increased the number of interviews that were completed but resulted in lower response rates than in-person data collection. Also, Quarter 4 in-person response rates were negatively affected by the coronavirus disease 2019 (COVID-19) pandemic.

and later years' estimates with 2001 and earlier NHSDA estimates. If comparisons such as these are made, it is recommended they be interpreted with caution.<sup>3</sup>

- 2015
  - The questionnaire underwent a partial redesign in 2015 to improve the quality of the NSDUH data and to address the changing needs of policymakers and researchers with regard to substance use and mental health issues. Details on these changes can be found in the 2015 codebook and other reports.
  - The number of allowable characters in a variable name was expanded for new variables created for 2015. Specifically, the number of allowable characters was expanded from a limit of 8 characters in 2014 and prior years to limits in 2015 of up to 9 characters for edited variables, up to 11 characters for imputed variables, and up to 12 characters for recoded variables.
  - The partial questionnaire redesign in 2015 caused many estimates to break trends. For more information on the effects of questionnaire changes since 2015 on trends, see the codebook variable notes or related NSDUH reports.<sup>4,5,6</sup>
- 2020
  - SAMHSA suspended in-person data collection on the 2020 NSDUH on March 16, 2020, because of the coronavirus disease 2019 (COVID-19) pandemic. With administrative approval, a small-scale data collection effort was conducted July 16-22, 2020, to assess the feasibility of safely resuming in-person data collection. The small-scale data collection effort was conducted in selected counties of two states where data collection was deemed safe based on state- and county-level COVID-19 metrics. To reduce the impact on NSDUH data collection due to the COVID-19 pandemic, on September 11, 2020, SAMHSA approved the addition of web-based data collection. In Quarter 4 of 2020 (i.e., October to December), web-based interviewing became the primary mode of NSDUH data collection. Conventional in-person data collection was carried out wherever it was considered safe to do so based on county- and state-level COVID-19 metrics.
  - The two modes of data collection yielded differences in response and nonresponse patterns, which, in turn, led to changes in various aspects of data processing, such as weighting. See Section 9, Sample Weights, for more weighting details. For details on the weight calibration for the 2020 PUF weights, see Section 16, Public Use File Weight Calibration.
  - Independent of the 2020 data collection changes due to COVID-19, the 2020 NSDUH already included a clinical validation study (CVS) planned for the first 6

<sup>6</sup> Center for Behavioral Health Statistics and Quality. (2016). *2015 National Survey on Drug Use and Health: Methodological summary and definitions*. Retrieved from <https://www.samhsa.gov/data/>

months of the 2020 NSDUH to assess revised substance use disorder (SUD) questions. The SUD questions, developed by SAMHSA, were revised to be consistent with the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5),<sup>7</sup> criteria for SUD. The CVS was halted when data collection was stopped on March 16, 2020, because of the COVID-19 pandemic. See Sections 2.1.2.1 and 2.2.1.2 of the 2020 methodological summary and definitions for more details on sampling and data collection for the CVS.

- Given the differences in data collection periods, modes, and other methodological procedures between 2020 and prior NSDUH years, comparisons of 2020 estimates with those of prior years of NSDUH are discouraged. Caution is advised if 2020 and prior year estimates are compared. Caution should also be used when attempting to distinguish the effects on estimates due to true changes in the population<sup>8</sup> (e.g., COVID-19, other events) from the effects due to methodological changes.

In addition to this introductory text, a description of the 2020 survey, including more detailed information on sample issues, can be found in several NSDUH documents that discuss methodological issues for 2020 or present key 2020 findings in tabular, graphical, and report formats. In the key findings documents, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from applicable prior years. The following 2020 NSDUH documents are listed in the order of their release dates in 2021:

- Substance Abuse and Mental Health Services Administration. (2021). *Key substance use and mental health indicators in the United States: Results from the 2020 National Survey on Drug Use and Health* (HHS Publication No. PEP21-07-01-003, NSDUH Series H-56). ## 2. Codebook Overview

As noted above, the 2020 data collection activities did not happen as planned in most of Quarters 2 and 3. The 2020 public use data file includes Quarter 1 (January to March 16) main study data, Quarter 3 data from the July 16-22 assessment, and Quarter 4 (October to December) data.

---

<sup>7</sup> American Psychiatric Association. (2013). *Diagnostic and statistical manual of mental disorders* (DSM-5) (5th ed.). Arlington, VA: Author.

<sup>8</sup> A true change in a population survey estimate across years is a change that is not plausibly explained by changes in survey data collection methods between those years.

For each variable in the 2020 public use data file, the codebook provides the variable name, a description of the variable, value codes and their meanings, and an unweighted univariate frequency distribution. The variable names in this codebook are the variable names used in the dataset.

To a great extent, variable names indicate the meaning of each variable. As much as possible, variables are named consistently across survey years when the content of questions is identical or similar or when the specifications for creating variables are not altered. When a variable does not have the same name across years, this is an indication that differences may exist. Due to the changes noted above for 2020, comparability of 2020 data with prior NSDUH data is currently unknown; therefore, the variables with no changes in definition or question content from the previous year kept the same names. Only variables that changed explicitly were given new names. Comparisons of 2020 data with prior years of NSDUH data, if done at all, should be done taking the 2020 changes into consideration, even in situations where a variable name remained the same.

Analysts are advised to consider the changes for 2020 and examine the codebook documentation in detail before conducting any analyses, particularly those involving the following:

- analyses performed from prior years that are being replicated in the current year,
- comparisons of data across multiple years,<sup>9</sup> or
- use of pooled data from multiple years.<sup>10</sup>

Documentation of the reasons for changing a variable's name can be found in comments above the specific variables and in corresponding appendix files within the codebook (if applicable). Typically, variable changes are documented the year they occur and in the following year if there are comparability issues to consider. However, the most current version of the documentation may not always describe relevant changes from prior years. Therefore, analysts who are doing a multiyear trend analysis are especially advised to examine documentation for all years of interest to identify any change over time that may affect the analysis of interest.<sup>11</sup> An analysis of trends is not recommended when using data where the impact of the questionnaire or methodological changes are confounded with true changes in the phenomenon being measured. If the change is considered minor and the likely impact on trend data would be minimal, then comparisons between years may be appropriate.

Analysts also are encouraged to refer to the instrument specifications for the 2020 survey in conjunction with their review of the codebook. The specifications for the 2020 survey provide detailed information about the logic governing how respondents were routed through the

---

<sup>9</sup> Due to methodological changes for 2020, significance testing between 2020 and prior years was not performed for the 2020 detailed tables or for the 2020 first findings report appendix tables.

<sup>10</sup> See Section 18, Special Types of Analyses.

<sup>11</sup> A variable crosswalk (also referred to as a “comparability chart”) that identifies which NSDUH variables are comparable across study years is available on the Substance Abuse and Mental Health Data Archive (SAMHDA) web pages at <https://datafiles.samhsa.gov/>.

questions in the interview and changes to the instrument relative to the 2019 survey.<sup>12</sup> The 2020 specifications<sup>13</sup> can be found on the SAMHSA website at <https://www.samhsa.gov/data/>.

### **3. Questionnaire Changes for the 2020 NSDUH**

In a typical year, NSDUH usually asks the same set of questions across all four quarters of data collection. Due to the COVID-19 pandemic necessitating multimode data collection methods for Quarter 4, modifications were needed for the questionnaire to move to web-based data collection. Additional questions were added to the survey in Quarter 4 to assess impacts of COVID-19 on substance use, mental health, and treatment. To protect respondents' confidentiality, the QUARTER variable, the MODE variable, all CVS-related variables (see Section 3.2), and all COVID-19-related variables (see Section 3.3) were excluded from the 2020 PUF. For details on the disclosure limitation methods used to produce the 2020 PUF, refer to Section 15, Confidentiality of Data.

The following text explains the modifications and revisions in the questionnaire described by the time period when changes were implemented.

#### **3.1 Changes for the Entire Data Collection Period**

Notable changes for the 2020 questionnaire that were available for the entire data collection period included the following:

- An emerging issues section was created that included questions from the 2019 survey and new questions on specific topics, such as vaping (for any substance and nicotine), synthetic cannabinoid use, and synthetic cathinone use.
  - The section included existing questions from the 2019 survey on the following topics: perceived recovery, receipt of medication-assisted substance use treatment, and kratom use.
  - Questions were added for the lifetime and most recent vaping of any substance and vaping of nicotine or tobacco.
  - Questions were added for the lifetime and most recent use of synthetic cannabinoids (referred to in the questionnaire for simplicity as “synthetic marijuana,” with the slang terms “fake weed,” “K2,” and “Spice”).
  - Questions were added for the lifetime and most recent use of synthetic cathinones (referred to in the questionnaire for simplicity as “synthetic stimulants,” with the slang terms “bath salts” and “flakka”).
  - Questions were added to measure SUD symptoms in the DSM-5 for marijuana withdrawal, prescription tranquilizer misuse withdrawal, and the symptom of craving (i.e., a strong desire or urge to use) for all substances.
- The market information for marijuana section included the following changes:
  - A question was added about purchasing marijuana from a store or dispensary.

---

<sup>12</sup> Center for Behavioral Health Statistics and Quality. (2020). *2019 National Survey on Drug Use and Health: CAI specifications for programming (English version)*. Retrieved from <https://www.samhsa.gov/data/>

<sup>13</sup> The 2020 NSDUH questionnaires are available at <https://www.samhsa.gov/data/>.

- Respondents who reported that they last purchased marijuana from a store or dispensary were skipped out of questions for other specific settings where they purchased marijuana.

### **3.2 Clinical Validation Study Questions in Quarter 1**

As noted above, the CVS was embedded within the first quarter of 2020 NSDUH data collection to assess SUD questions that were revised to be consistent with the DSM-5 criteria for SUD. NSDUH respondents in Quarter 1 (January to March 16, 2020) who answered the survey in English and reported using alcohol or illicit drugs in the past 12 months were randomly assigned (using responses to survey questions located earlier in the questionnaire on cigarette, alcohol, and marijuana use) to be asked revised SUD questions based on the DSM-5 criteria or the standard NSDUH SUD questions based on the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV),<sup>14</sup> criteria. Respondents who received the DSM-IV SUD questions also were eligible to receive questions in the emerging issues section of the interview for marijuana withdrawal symptoms, prescription tranquilizer withdrawal symptoms, and craving for all substances they used or misused in the past year. These additional symptoms applied to the DSM-5 SUD outcome but were not measured in the existing DSM-IV SUD questions.

### **3.3 Questionnaire Changes for Quarter 4, Regardless of Interview Mode**

Several key questionnaire changes were made for the resumption of data collection in Quarter 4. Unless noted otherwise, these changes were made for both the in-person and web-based questionnaires. As noted above, for the 2020 PUF, the variables QUARTER and MODE were dropped to adequately protect respondents' confidentiality. Any data collected specifically by mode or quarter were also dropped from the PUF, including any data collected only for Quarter 4 as described in the bullets below. Key changes that needed to be made for web administration are described in Section 3.4.

- The Beginning ACASI section of the in-person interview, which guides the FI through the process of explaining important laptop keys and specific interview program functions to the respondent, was redesigned to be self-administered to minimize the risk of COVID-19 transmission. This modification allowed the FI to pass the laptop computer to a respondent and maintain social distancing without sacrificing necessary instructions.
- The DSM-5 SUD questions that were administered for the CVS in Quarter 1 were removed for Quarter 4 data collection in the in-person and web questionnaires. (Additional DSM-5 questions remained in the emerging issues section for Quarter 4.)
- Two questions were added to the drug treatment section to measure the use of telehealth services for alcohol or drug use issues in the past 12 months.
- A question was added to the health section to measure the use of telehealth services for health care in the past 12 months. Respondents who reported telehealth service use in the past 12 months were eligible to be asked subsequent questions in the health section that asked whether health care providers obtained information about substance

---

<sup>14</sup> American Psychiatric Association. (1994). *Diagnostic and statistical manual of mental disorders* (DSM-IV) (4th ed.). Washington, DC: Author.

- use (i.e., the use of tobacco, alcohol, or specific illicit drugs) or offered health care advice related to respondents' substance use.
- A question was added to the adult mental health service utilization section and to the youth mental health service utilization section to measure use of telehealth services for mental health or behavioral services in the past 12 months.
  - All adult respondents received questions about suicide plans or attempts in the past 12 months, regardless of whether they reported having serious thoughts of suicide in the past 12 months. (In Quarter 1 and in prior years, respondents needed to report serious thoughts of suicide to be asked questions about suicide plans or attempts.)
  - Follow-up questions were added after each adult suicidality item in the mental health section if respondents reported serious thoughts of suicide, suicide plans, or suicide attempts in the past 12 months. These follow-up questions asked whether these thoughts of suicide, suicide plans, or suicide attempts were because of the COVID-19 pandemic.
  - Suicide items were added for youths in the youth mental health service utilization section.
    - These items mirrored the adult suicide items in Quarter 4, including the new COVID-19 follow-up questions.
    - An additional text screen was provided for youths who reported serious thoughts of suicide, suicide plans, or suicide attempts. This text screen provided information on how to contact the National Lifeline Network.
  - A series of self-administered questions related to the COVID-19 pandemic were added toward the end of the interview for adults and youths. These questions asked about respondents' perceptions of effects of the COVID-19 pandemic on their mental health, substance use, finances, living situation, and access to services.
  - For the in-person interview, instructions were changed at the end of the interview to limit contact between the FI and respondent during the quality control and incentive procedures.

### **3.4 Questionnaire Changes for Quarter 4 Web Interviews**

Questionnaire changes were necessary for web administration. The following changes were made to facilitate this additional data collection mode.

- A variable that listed whether the selected respondent was an adult or a youth was "preloaded" to the interview so that the correct informed consent information could be displayed at the beginning of the interview.
- Information about the respondent's state of residence and sample information from the household screener (i.e., whether two people were selected at the dwelling unit (DU) and whether an adolescent aged 12 to 17 was selected) was "preloaded" because there were no FIs to enter the information.
- Information previously entered by the FIs, such as language of the interview and the informed consent process, was adapted to be self-administered.

- A PIN creation process was added after the informed consent process, but before any questions, to safeguard respondent data and allow respondents to reenter the interview at a later time.
- Sections that were interviewer administered using CAPI in the in-person interviews were modified for self-administration. For example, references to showcards in the in-person CAPI sections were dropped from the web interview because those did not apply for self-administration.
- For households in which two people were selected, one of them was aged 12 to 17, and the second person was an adult, eligibility for the parenting experiences section was determined by asking at the start of the parenting experiences section whether the adult respondent was the parent of the 12- to 17-year-old who was selected. In the in-person interviews, this information was entered by FIs at the beginning of the interview.
- Hard errors and consistency checks were simplified throughout the interview to avoid respondent confusion and frustration.
- The web questionnaire did not include audio. Instead, pronunciations were spelled out visually on several screens, particularly for hallucinogens, inhalants, and prescription drug introduction screens, to help youths and respondents with a lower reading level understand the questions accurately.

On-screen interviewer notes were either removed from the web questionnaire or adapted for self-administration.

#### **4. Additional Historical Changes to NSDUH Variables of Note**

This section documents notable changes to NSDUH variables that occurred recently but prior to 2020. The changes noted in this section could affect comparability of NSDUH variables with variables on data files for NSDUH years prior to the implementation of these changes. Given the differences in data collection periods and other methodological procedures between 2020 and prior NSDUH years, caution is advised when comparing 2020 and prior years.

Extensive changes were made to NSDUH variables in 2015 because of the partial redesign of the 2015 NSDUH questionnaire. These changes are described in the section on Questionnaire Changes for the 2015 NSDUH in the codebook introduction for the 2015 NSDUH PUF on the SAMHDA website at <https://datafiles.samhsa.gov/>.

Since 2008, a statistical model has been employed to predict whether adult NSDUH respondents had serious, moderate, mild, or no mental illness based on their answers to certain NSDUH questions. For the 2012 NSDUH, this model was revised to produce more accurate estimates. This revised 2012 model was used to produce the mental illness estimates for 2012 to 2020. In addition, comparable estimates were recomputed for 2008 through 2011. For more information on how mental illness estimates were calculated, see this codebook's appendix titled Recoded Mental Health. The mental illness variables included in the 2020 NSDUH data files are based on the revised 2012 model. Note that the mental illness variables (e.g., SMIYR\_U, AMIYR\_U) are not recommended to be used when analyzing variables for past year suicidal thoughts, past year major depressive episode (MDE), the Kessler-6 (K6) distress scale, or the World Health Organization Disability Assessment Schedule (WHODAS) scale, nor are they

recommended to be used when analyzing other variables closely linked with these variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, lifetime MDE, serious psychological distress [SPD], or components used in the K6 or WHODAS scales). For more details, see this codebook's appendix titled Recoded Mental Health.

In the 2013 questionnaire and onward, two new response categories were added to the question about race (QD05) in response to changes in U.S. Department of Health and Human Services (HHS) standards of data collection. The response options now include "Guamanian or Chamorro" and "Samoan." To accommodate this change, two new imputation-revised variables were created along with their corresponding imputation indicators: IRRACEGC for Guamanian or Chamorro and IRRACESM for Samoan.<sup>15</sup> The change to QD05 also affected the creation of the "Other Pacific Islander" variable IRRACEPI. Prior to 2013, IRRACEPI covered Pacific Islanders who are not Native Hawaiians. Beginning in 2013, the variable name was changed to IRRACPI2 and now covers Pacific Islanders who are not Native Hawaiians, Guamanians or Chamorros, or Samoans. Despite the change to the questionnaire, the levels of the detailed race variable IRNWRACE were not changed. Guamanian or Chamorro and Samoan respondents continued to be treated as Other Pacific Islanders. Therefore, little to no impact is expected on the race/ethnicity variables IRNWRACE, NEWRACE1, NEWRACE2, EXPRACE, and EXPRACE2.

Since 2013, questions also have been included that asked about height and weight. Respondents were asked to report their weight in pounds or kilograms and their height in feet, inches, meters, or centimeters. Edited and recoded variables were created that converted all of the responses from the weight variable into pounds (WTPOUND2) and the height data into inches (HTINCHE2). Using these data, a new recoded variable measuring body mass index (BMI2) was included on the PUF, and the documentation can be found in the Recoded Pregnancy and Health Care section of this codebook. Note that this variable has not been used in the detailed tables. The new recoded variable called BMI2 was created as a continuous variable based on the following formula:  $BMI2 = [WTPOUND2 \div (HTINCHE2)^2] \times 703$ . Unknown response values for the edited weight variable (WTPOUND2) of 9985, 9994, 9997, or 9998 or the edited height variable (HTINCHE2) of 985, 994, 997, or 998 were defined as SAS® missing for the recoded BMI2.<sup>16</sup>

## 5. Organization of the Data File

The PUF described here is made available as an ASCII file with 2,892 variables and 32,893 observations. *Three program files are made available to read the ASCII file into SAS, SPSS, or Stata. The file also is made available as a SAS transport (CPORT) file, SPSS system file, Stata system file, and ASCII tab-delimited file. All of the data and program files are available from SAMHDA at <https://datafiles.samhsa.gov/>.*

The overall organization of the file is shown in the Table of Contents of this document. The first portion of this codebook consists of documentation for edited variables from drug

---

<sup>15</sup> For an explanation of imputation-revised variables, see Section 12, Statistical Imputation.

<sup>16</sup> The formula for calculating BMI for use in BMI2 is from the Centers for Disease Control and Prevention (CDC) website: [https://www.cdc.gov/healthyweight/assessing/bmi/adult\\_bmi/index.html?s\\_cid=tw\\_ob064](https://www.cdc.gov/healthyweight/assessing/bmi/adult_bmi/index.html?s_cid=tw_ob064).

sections, followed by documentation for imputation-revised and selected recoded versions of these drug variables. Documentation for edited variables from the second set of self-administered sections and demographic questions are in later sections; each of these later sections is immediately followed by sections corresponding to imputation-revised and recoded variables, where applicable. *Where imputed or recoded variables are provided, users are encouraged to use them to produce estimates rather than using raw or edited variables from the interview.*

Most edited variables contain missing data (e.g., the edited variable CIGREC for the most recent use of cigarettes); see Section 11.3, Standard Code Conventions, for a description of the codes given to different types of missing data for edited variables. For each edited variable, the number of observations assigned a given missing data code is shown in the entry for that variable.

Imputation-revised variables, as well as selected recoded versions of these variables, are included for selected demographic variables, drug use variables, and SUD variables based on the DSM-5 criteria. As noted previously, these imputed and recoded variables are in separate sections following the edited variables. In particular, the recoded drug use variables include indicators for lifetime, past year, and past month substance use. The imputation-revised drug use variables served as the starting point for the recoded drug use variables. Imputation-revised demographic variables are documented toward the end of the codebook. Imputed variables for SUDs based on the DSM-5 criteria also are included in 2020 and are documented in the Imputed DSM-5 Substance Use Disorder and Recoded DSM-5 Substance Use Disorder sections of the codebook. Imputed variables for SUD based on the DSM-IV criteria are also included and are imputed for a subset of illicit drugs as documented in the Imputed Substance Dependence and Abuse and Recoded Substance Dependence and Abuse sections of the codebook. Missing values for all imputation-revised variables have been imputed using the statistical imputation procedures described in Section 12, Statistical Imputation. Imputation indicators are provided for each variable so that users may easily determine whether an observation contains data from the questionnaire or from an imputed value.

Following the sections for substance use variables, edited variables from additional self-administered questionnaire sections comprise the next major section in the codebook. Intermixed within this major section of the codebook are sections of recoded variables. The edited and/or imputed variables are used as source variables for the recoded variables. For example, edited variables from the section of the interview pertaining to the receipt of treatment for the use of alcohol or illicit drugs (Drug Treatment section in this codebook) were used to create recoded summary measures for the receipt of substance use treatment. Unlike variables in the drug sections, however, imputed variables were not created for many variables from this second section of the interview, except where noted. Consequently, these recoded variables may still have missing values. The missing data codes contained in the source variables and defined in Section 11.3, Standard Code Conventions, are recoded to the standard missing code (.) for recoded variables. It is intended that cases containing these missing codes be excluded from an analysis. Note that in some situations where recoded variables are created from edited variables, missing values are set to a value of 0 instead of to the standard code for missing data (.)

Within the recoded sections of the codebook, detailed information is provided in the variable documentation about how levels of source variables are used to define recoded

variables. Note that for recoded variables that include “OTHER, Specify” data or logically assigned data (as defined in Section 11.3, Standard Code Conventions), values may be listed in the documentation that do not exist for the current survey year. Because of fluctuations in the data, source variable values may not exist consistently across years. However, to aid in cross-year analyses, all possible source variable values have been retained in the documentation. For example, a recoded variable may document a “yes” using both source variable values of “1 = Yes” and “3 = Logically Assigned Yes,” even if the “3” is not applicable for the current survey year. To alert users, notes have been placed at the top of recoded sections containing variables that include source values even if they do not apply to the current survey year.

In many instances, the codebook itself also indicates in parentheses the question names used in the NSDUH instrument that were most relevant for creating an edited variable. As much as possible, the codebook shows the key source variables used in creating edited, imputed, or recoded variables. In particular, an important feature of the transition to CAI in 1999 was that respondents could be routed to different versions of a question based on prior information from the interview. For example, respondents who initiated use of a drug within 1 year of their current age were asked more detailed questions about the year and month in which they first used that drug. Depending on their age, date of birth, and interview date, respondents could be routed to one of three possible questions to identify the year in which they first used a drug (e.g., CG04a, CG04b, or CG04c for cigarettes). Similarly, respondents could be routed to one of two possible questions to determine the month in which they first used a drug (e.g., CG04c and CG04d for cigarettes). To facilitate analyses, therefore, responses from these multiple year-of-first-use and month-of-first-use questions were combined into one single year-of-first-use variable and one single month-of-first-use variable for each drug, as shown for the variables CIGYFU and CIGMFU. Thus, the codebook documentation shows that CIGYFU was based on data from the source variables CG04a through CG04c, and CIGMFU was based on data from the source variables CG04c and CG04d. For the most complete information about the logic for asking questions in the interview, however, data file users should refer to the 2020 questionnaires.

## **6. Strengths and Limitations of NSDUH**

NSDUH is the primary nationally representative source of annual estimates of drug use and mental illness among civilian members of the noninstitutionalized population in the United States. In addition, the large and dispersed NSDUH sample enables not only state-level estimates but also estimates for substate areas.

Most of the NSDUH questions administered in person are administered with ACASI, which is designed to provide the respondent with a highly private and confidential mode for responding to questions to increase the level of honest reporting of illicit drug use and other sensitive behaviors. Web respondents are asked to be in a private location within the home and to affirm before starting that they are in a private location.

Although NSDUH is useful for many purposes, it has certain limitations. First, the data are based on self-reports of drug use, and their value depends on respondents’ truthfulness and memory. Although some experimental studies have established the validity of self-reported data in similar contexts and NSDUH procedures were designed to encourage honesty and recall, some underreporting and overreporting may take place. To aid respondent recall, the prescription drug

questions in 2020 allowed respondents to report any use or misuse in the past 12 months of specific related medications (e.g., the tranquilizers Xanax®, Xanax® XR, generic alprazolam, and generic extended-release alprazolam). These self-reports capture information on the use or misuse of prescription drugs that contain a given active ingredient. However, these self-reports are not necessarily accurate for identifying the exact drugs respondents took, especially when respondents identify certain drugs by their brand names (e.g., if a respondent actually took the generic drug alprazolam but reported use or misuse of the brand name tranquilizer Xanax® because of name recognition). For this reason, the PUF includes recoded variables for subtypes of related prescription drugs (e.g., alprazolam products) but, with few exceptions, does not include variables for individual prescription drugs.

Second, the survey is cross-sectional rather than longitudinal. That is, individuals were interviewed only once and were not followed for additional interviews in subsequent years. Each year's survey, therefore, provides an overview of the prevalence of drug use at a specific point in time rather than a view of how drug use changes over time for specific individuals.

Third, because the target population of the survey is defined as the civilian, noninstitutionalized population of the United States, a small proportion (approximately 3 percent) of the population is excluded.<sup>17</sup> The subpopulations excluded are members of the active-duty military and people in institutional group quarters (e.g., hospitals, prisons, nursing homes, treatment centers). If the drug use of these groups differs from that of the civilian, noninstitutionalized population, NSDUH may provide slightly inaccurate estimates of substance use and mental health in the total population. This may be particularly true for prevalence estimates for less commonly used drugs, such as heroin.

Fourth, the 2020 NSDUH data have additional limitations that data from prior years did not have. Because of the limited data collection period, Quarters 2 and 3 were largely unrepresented in the 2020 data. Although the total number of interviews completed in Quarter 4 surpassed the minimum number of interviews needed to produce national estimates with acceptable precision for people aged 12 or older, the number of interviews from adolescents aged 12 to 17 in Quarter 4 was lower than expected. Other potential limitations of the web survey data collected in Quarter 4 of 2020, such as differences in data collection period, survey mode, response rates, and measures used, must also be considered. For the 2020 PUF, because the variable QUARTER is not available, quarterly analysis of PUF data is not possible.

## 7. Sample Design Overview

The 2020 NSDUH sample design is part of a multiyear, coordinated design that was developed for the 2014 through 2022 NSDUHs. The coordinated sample design is state-based, with an independent, multistage area probability sample within each state and the District of Columbia. States were the first level of stratification. Each state was further stratified into approximately equally populated state sampling regions (SSRs). Creation of the multistage area probability sample then involved selecting census tracts within each SSR (Stage 1), census block

---

<sup>17</sup> Information from the 2010 census suggests that the civilian, noninstitutionalized population includes at least 97 percent of the total U.S. population. See the following reference: Lofquist, D., Lugaila, T., O'Connell, M., & Feliz, S. (2012, April). *Households and families: 2010* (C2010BR-14, 2010 Census Briefs). Retrieved from <https://www.census.gov/prod/cen2010/briefs/c2010br-14.pdf>

groups within census tracts (Stage 2), and area segments (i.e., a collection of census blocks) within census block groups (Stage 3). Finally, DUs were selected within segments (Stage 4), and (within each selected DU) up to two residents who were at least 12 years old were selected for the interview (Stage 5). The complete sample design is documented in the 2020 NSDUH sample design report.<sup>[18](#)</sup>

The coordinated design facilitates a 50 percent overlap in third-stage units (area segments [see below]) between each 2 successive years from 2014 through 2022.<sup>[19](#)</sup> The overlap is intended to increase the precision of estimates in year-to-year trend analyses because of the expected positive correlation resulting from the overlapping sample between successive survey years.

The 2014 through 2022 design allows for computation of estimates by state in all 50 states plus the District of Columbia. Compared with the sample allocation in prior years, the 2014 through 2022 design allows for a more cost-efficient sample allocation to the largest states, while maintaining a sufficient sample size in each of the smaller states to support small area estimation at the state and substate levels. The sample is designed to yield 4,560 completed interviews in California; 3,300 completed interviews each in Florida, New York, and Texas; 2,400 completed interviews each in Illinois, Michigan, Ohio, and Pennsylvania; 1,500 completed interviews each in Georgia, New Jersey, North Carolina, and Virginia; 967 completed interviews in Hawaii; and 960 completed interviews in each of the remaining 37 states and the District of Columbia—for a total national target sample size of 67,507. This large target sample size permits SAMHSA to report precise estimates for demographic subgroups at the national level without needing to oversample specially targeted demographics other than age groups. Because geographic identifiers like state are not on the 2020 PUF, only national analysis of data is possible.

To support the CVS, the 2020 NSDUH national target sample size of 67,507 interviews was supplemented with 1,500 interviews proportionally allocated to states and age groups in Quarters 1 and 2 (i.e., January to June 2020). The CVS was originally planned for the first 6 months of the 2020 NSDUH to assess a revised NSDUH section on SUDs according to the DSM-5 criteria. Including the supplement, the expanded target sample size for the 2020 NSDUH was 69,007 interviews. From the expanded sample, 1,500 respondents were expected to be selected for the CVS based on their responses to selected questionnaire items. Logic in the NSDUH questionnaire then assigned respondents selected for the CVS sample to receive the DSM-5 SUD questions. All other respondents received the standard set of NSDUH SUD questions that used the DSM-IV criteria. Given the public health emergency related to COVID-19, NSDUH in-person data collection was suspended and the CVS was limited to data collected in Quarter 1. Except for a small-scale data collection in July to test new safety procedures, the samples intended for Quarters 2 and 3 were worked along with the sample selected for Quarter 4 during the Quarter 4 time frame. Sample dwelling units (SDUs) in segments where the risk of COVID-19 transmission and infection were deemed to be low were released for in-person data

---

<sup>[18](#)</sup> Center for Behavioral Health Statistics and Quality. (2021). *2020 National Survey on Drug Use and Health (NSDUH) methodological resource book, Section 2: Sample design report*. Rockville, MD: Substance Abuse and Mental Health Services Administration.

<sup>[19](#)</sup> In segments used in 2 successive years, only addresses not sampled in the first year may be included in the second year's sample.

collection. Most of the SDUs, however, were mailed an invitation to participate via the web.<sup>20</sup> Because the web mode has a lower response rate than in-person interviewing, additional SDUs were selected and worked in the same segments as the original Quarter 2-4 samples. For more information on the impact of COVID-19 on the 2020 NSDUH sample design, see the 2020 NSDUH sample design report. As noted above, CVS-related data are not included in the 2020 PUF.

## 7.1 Stratification and Selection of Primary, Secondary, and Tertiary Sampling Units (Census Tracts, Census Block Groups, and Area Segments)

Within each state, sampling strata called SSRs were formed. Based on a composite size measure, states were partitioned geographically into roughly equally sized regions. In other words, regions were formed such that each area within a state yielded, in expectation, roughly the same number of interviews during each data collection period. The partitioning divided the United States into a total of 750 SSRs, resulting from 36 SSRs in California; 30 SSRs each in Florida, New York, and Texas; 24 SSRs each in Illinois, Michigan, Ohio, and Pennsylvania; 15 SSRs each in Georgia, New Jersey, North Carolina, and Virginia; and 12 SSRs each in the remaining 38 states and the District of Columbia.

The first stage of selection for the 2014 through 2022 NSDUHs was census tracts. This stage of selection began with the construction of an area sample frame that contained one record for each census tract in the United States. If necessary, census tracts were aggregated within SSRs until each tract<sup>21</sup> met the minimum DU<sup>22</sup> requirement. In California, Florida, Georgia, Illinois, Michigan, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Texas, and Virginia, this minimum size requirement was 250 DUs in urban areas and 200 DUs in rural areas.<sup>23</sup> In the remaining states and the District of Columbia, the minimum requirement was 150 DUs in urban areas and 100 DUs in rural areas. These census tracts served as the primary sampling units (PSUs) for the coordinated 9-year sample.

Before selecting census tracts, additional implicit stratification was achieved by sorting the first-stage sampling units by a CBSA/SES<sup>24</sup> (core-based statistical area/socioeconomic status) indicator<sup>25</sup> and by the percentage of the population who are not Hispanic or Latino and

---

<sup>20</sup> See Sections 2.2.2.4 and 2.2.2.3 of the 2020 methodological summary and definitions for more details on the data collection procedures in Quarter 4.

<sup>21</sup> For the remainder of the discussion, first-stage sampling units are referred to as “census tracts” even though each first-stage sampling unit contains one or more census tracts.

<sup>22</sup> DU counts were obtained from the 2010 decennial census data supplemented with revised population counts from Claritas (see <https://www.claritas.com/>).

<sup>23</sup> The basis for the differing minimum DU requirement in urban and rural areas is that it is more difficult to meet the requirement in rural areas, 100 DUs are sufficient to support one field test and two main study samples in the smaller states, and 200 DUs are sufficient to support three samples in the larger sample states.

<sup>24</sup> CBSAs include metropolitan and micropolitan statistical areas, as defined in the following reference: Office of Management and Budget. (2009, December 1). *OMB Bulletin No. 10-02: Update of statistical area definitions and guidance on their uses*. Retrieved from <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/bulletins/2010/b10-02.pdf>

<sup>25</sup> The CBSA/SES indicator was defined using 2006-2010 American Community Survey (ACS) estimates, 2010 census data, and the December 2009 CBSA definition. Four categories are defined as follows: (1) CBSA/low SES, (2) CBSA/high SES, (3) non-CBSA/low SES, and (4) non-CBSA/high SES.

White. From this well-ordered sample frame, 48 census tracts per SSR were selected with probabilities proportionate to a composite size measure and with minimum replacement.

For the second stage of selection, adjacent census block groups were collapsed as needed within selected census tracts. Compared with years prior to 2014, the selection of a census block group is an additional stage of selection added to facilitate possible transitioning to an address-based sampling design in the future. The block groups were required to have the same minimum number of DUs as the census tracts from which they were selected (150 or 250 in urban areas and 100 or 200 in rural areas, according to state). The resulting block groups were then sorted in the order in which they were formed, and one census block group<sup>26</sup> was selected per selected census tract with probability proportionate to a composite size measure.

Because census block groups generally exceed the minimum DU requirement, one smaller geographic area was selected within each sampled census block group. For this third stage of sampling, each selected census block group was partitioned into small geographic areas composed of adjacent census blocks. These geographic clusters of blocks are referred to as “segments” and are the tertiary sampling units for the coordinated sample design. A sample “dwelling unit” in NSDUH refers to either a housing unit or a group quarters listing unit, such as a dormitory room or a shelter bed. To support the overlapping sample design and any special supplemental sample or field test SAMHSA might wish to conduct, segments were formed to contain a minimum of 150 or 250 DUs in urban areas and 100 or 200 DUs in rural areas, according to state.

One segment was selected within each sampled census block group with probability proportionate to size. The 48 selected segments then were randomly assigned to a survey year and quarter of data collection.

Note that geographic identifiers like state and census blocks are not included in any NSDUH PUFs.

## 7.2 Selection of Dwelling Units

The primary objective of the fourth stage of sample selection (listing units) was to select the minimum number of DUs needed in each segment to meet the targeted sample sizes for all age groups. For the 2014 through 2022 NSDUHs, each state sample was allocated to age groups as follows: 25 percent for youths aged 12 to 17, 25 percent for young adults aged 18 to 25, 15 percent for adults aged 26 to 34, 20 percent for adults aged 35 to 49, and 15 percent for adults aged 50 or older. The size measures used in selecting the area segments were coordinated with the DU and person selection process so that a nearly self-weighting sample could be achieved in each of the five age groups. Departures from the self-weighting objective occurred for several reasons, including the following: (1) advance projections on the number of DUs did not accurately reflect the current housing inventory; (2) maximum DU sample sizes were preset to control the FI workload and to allow unused addresses to be available for the next year’s survey; and (3) the person selection probabilities were constrained so that no more than two individuals could be selected per DU. An iterative sample allocation process was followed to adjust for these

---

<sup>26</sup> For the remainder of the discussion, second-stage sampling units are referred to as “census block groups” even though each second-stage sampling unit contains one or more census block groups.

additional constraints. In addition, the DU sample allocation in each area segment was adjusted to allow for DU eligibility, for screening nonresponse, and for person nonresponse.

In advance of the survey period, specially trained listers had visited each area segment and listed all addresses for housing units and eligible group quarters units in a prescribed order. Systematic sampling was used to select the allocated sample of addresses from each segment.<sup>27</sup>

### **7.3 Selection of Individuals**

After DU selections were made, the DU was rostered to identify all survey-eligible people residing at the DU. For Quarter 1, the small-scale data collection in July 2020, and areas eligible for in-person data collection during the multimode data collection period, FIs visited the selected DUs to identify and roster all survey-eligible people. During the multimode data collection period and through the web screening interview, an eligible member of the selected DU provided roster information. Using this roster information, the electronic or web screening instrument automatically selected zero, one, or two individuals to be interviewed using preset state and age group sampling rates and a random number specified for the address.

Unlike the 2005 through 2013 NSDUHs, the “half-open” interval (HOI) rule was not implemented in the 2014 through 2022 NSDUHs. This special procedure identified any new (since the time of listing) housing unit or any DU missed during the advance listing process. Any new or missed DU (or DUs) following immediately after a sample DU and up to but not including the next initially listed address (or addresses) in the prescribed order of listing also was included in the sample. Eliminating the HOI rule in 2014 decreased the burden on FIs and simplified training and the screening process. This decrease in burden outweighed the small amount of coverage afforded by the HOI rule. Because the majority of missed DUs are found on the premises of sampled DUs, the 2014 through 2022 NSDUHs had in place a procedure for checking for and adding missed DUs on the premises of sampled DUs. During the screening interview, FIs asked the screening respondent about other units on the property of the selected DU.<sup>28</sup> If missing from the original list, these DUs also were included in the sample.

### **7.4 Sample Design Variables**

The sample for the 2020 NSDUH was selected using a multistage, deeply stratified sample design. The variables on the full restricted-use analytic data file represent each stage of sample selection. To ensure respondents’ confidentiality, the sample design variables described in this section are not included in any NSDUH PUFs.

Stage 1: The 2020 NSDUH design includes a sample from each of the 50 states plus the District of Columbia. SSRs were formed within each state based on composite size measures, roughly geographically partitioning the state into equally sized regions.

---

<sup>27</sup> This had the effect of creating noncompact clusters (selection from a list), which differ from compact clusters in that not all units within the cluster are included in the sample. Although compact cluster designs are less costly and more stable, a noncompact cluster design was used because it provides for greater heterogeneity of dwellings within the sample. Also, social interaction (contagion) among neighboring dwellings is sometimes introduced with compact clusters. See the following reference: Kish, L. (1965). *Survey sampling*. New York, NY: John Wiley.

<sup>28</sup> The missed DU question was not asked of web screening respondents.

A sample of 48 census tracts was selected within each SSR. Census tracts are considered the PSUs and can be identified using the STATE, SSREGION, and SEGID<sup>29</sup> variables. Only eight census tracts per SSR were used for the 2020 sample.

- Stage 2: Adjacent census block groups were aggregated within selected census tracts as necessary to form the second-stage sampling units. One census block group was selected per sampled census tract. A total of 48 census block groups was selected within each SSR. Census block groups can be identified using the STATE, SSREGION, and SEGID variables. Eight census block groups per SSR, one from each sampled census tract, were used for the 2020 sample.
- Stage 3: The third stage of sampling consisted of partitioning the selected census block groups into smaller geographic areas, called “segments.” Segments are defined by joining contiguous census blocks within each selected census block group. Segments can be identified on the data file using the SEGID variable.
- Stage 4: After census tracts, census block groups, and segments were selected, the fourth stage of selection consisted of selecting DUs within each segment. The DU selection rate was based on the state to which a particular segment belonged. State classification was utilized for computation of eligibility, screener and interview response rates, and expected person yield per DU. State classifications can be identified with the STATE variable, and DUs can be identified with the ENCCASE variable.
- Stage 5: At the last stage of selection, individuals were selected within screened DUs based on the age group composition of the DU residents. The person-level variable used to determine the selection included AGE. The data file contains one record representing each responding selected person from Stage 5 (36,284 individuals). To protect the confidentiality of these respondents, the full restricted-use analytic data file was treated using a statistical disclosure limitation method while ensuring that the data continue to be representative of civilian members of the noninstitutionalized population in the United States. The resulting public use data file contains 32,893 records.

A more detailed explanation of the sample design and sample selection procedures at each stage of the design appears in the 2020 NSDUH sample design report.

## 8. Data Collection and Response Rates

The 2020 NSDUH data collection effort was directed by RTI staff members. All web-based data collection activities were coordinated by in-house management staff, whereas in-person data collection activities were coordinated by both in-house and remote management staff. For in-person data collection, RTI maintained a field staff of approximately 650 FIs.

Data collection methods were modified during 2020 due to the public health emergency related to COVID-19 to ensure the safety of the public and FIs. Quarter 1 (January to March 2020) was completed using standard NSDUH protocols with in-person data collection. However, Quarter 1 data collection ended 15 days early when work was suspended on March 16, 2020.

---

<sup>29</sup> One segment was selected from each sampled census block group within each sampled census tract, so the census tract, census block group, and segment can all be identified by the SEGID variable.

NSDUH project management at RTI began working closely with SAMHSA and RTI's Infectious Disease Response Team (IDRT), Executive Leadership Team (ELT), and Institutional Review Board (IRB) to determine when and where it would be safe to resume in-person data collection.

To assess the feasibility of resuming in-person data collection, the IDRT advised conducting a small-scale data collection effort. SAMHSA, the ELT, and the IRB approved a 1-week small-scale data collection effort that was conducted July 16-22, 2020. Revisions were made to protocols, processes, and materials to ensure the safety of respondents and FIs. Revisions to protocols are outlined in Section 2.2.1.1.2 of the 2020 methodological summary and definitions. Analysis of the data and results of a debriefing session with FIs indicated that overall the safety procedures used during the small-scale data collection effort did not have a negative effect on respondents' willingness to participate in the survey.

Data collection resumed in Quarter 4, but in-person data collection was limited to a small number of eligible states and counties due to COVID-19 infection rates. Web-based screening and interviewing procedures were developed to account for suspended data collection in Quarter 2 and most of Quarter 3 and to maximize the number of completed interviews for national estimates. NSDUH data collection in Quarter 4 used in-person and web-based procedures. Sections 2.2.1.1 and 2.2.1.3 of the 2020 methodological summary and definitions provide detailed procedures for both in-person and web-based data collection.

A total final sample of 36,284 interviews (on the full analytic data file) was obtained for the 2020 survey. Strategies for ensuring the best participation rates possible resulted in a weighted screening response rate of 25.71 percent and a weighted interview response rate of 60.41 percent for the 2020 NSDUH. Although the addition of web-based data collection in Quarter 4 increased the number of interviews that were completed, web-based data collection yielded lower response rates than in-person data collection. Further, Quarter 4 in-person response rates were negatively affected by the COVID-19 pandemic. Specifically, the pandemic could have exacerbated people's reluctance to open their doors to FIs in areas where in-person interviewing was allowed. FIs also could have had a shorter amount of time to follow up with households that started out as being eligible for in-person data collection but became ineligible based on changing state- and county-level health metrics.

Throughout the course of the study, respondent anonymity and the privacy of responses were protected by separating identifying information from survey responses. Respondents were assured their identities and responses would be handled in strict compliance with federal law. As discussed above, the questionnaire itself and the interviewing procedures were designed to enhance the privacy of responses, especially during segments of the interview in which questions of a sensitive nature were posed. During in-person interviews, answers to sensitive questions were gathered using ACASI. However, the ACASI technology was not available in the web interview. The decision to not include ACASI as part the web interviews was made following consultation with subject matter experts, which concluded that offering audio would result in a larger risk of breeching confidentiality (allowing others to potentially hear the questions being asked or the responses being entered) than not having audio at all.

A more detailed explanation of NSDUH's data collection procedures will appear in the 2020 NSDUH data collection final report, which will be available in 2022.<sup>30</sup>

## 9. Sample Weights

This section describes in general how the weights were produced for the full restricted-use analytic file. For details on the weight calibration specific to the 2020 PUF, refer to Section 16, Public Use File Weight Calibration.

The estimates yielded by NSDUH are based on sample survey data rather than on complete data for the entire population, which means the data must be weighted to obtain unbiased estimates for survey outcomes in the population represented by the 2020 NSDUH. The "final analysis weight" of the  $i$ th respondent, say  $w_i$ , can be interpreted as the number of sampling units in the NSDUH target population represented by the  $i$ th respondent. The sum of the weights over all respondents is used to estimate the size of the total target population:

$$\sum_i w_i = \text{estimated size of the target population},$$

where the summation is over all of the respondents in the 2020 NSDUH.

For the 2020 NSDUH, three types of analysis weights were developed: (1) the person-level analysis weights, (2) questionnaire dwelling unit (QDU)-level weights, and (3) person pair-level weights.

To account for the disruption in the 2020 data collection due to the COVID-19 pandemic and the subsequent introduction of multimode (in-person and web) data collection in Quarter 4, modifications were made to the 2020 NSDUH weighting process. See Section 2.3.4.2 of the methodological summary and definitions for all the details on the modifications. One main modification was creating separate 2020 person-level main analysis weights for Quarter 1 and Quarter 4 (including the interviews from July), as well as person-level analysis weights for 2020 combined Quarters 1 and 4. This modification was applied to analyze both quarterly data and combined data using the full analytic data file. A second modification to the weights for 2020 was the addition of educational attainment to the control totals for final poststratification because the web respondents had a higher average level of educational attainment than the in-person respondents. A third modification was to add an implicit unknown eligibility adjustment if DUs were selected for web-based data collection but were nonrespondents at the screening stage. When data are collected in person, FIs can identify ineligible DUs (e.g., vacancies) to allow the ineligible DUs to be removed from the sample before weighting. For web-based data collection, however, DU members needed to initiate the screening process. Consequently, web-based data collection yielded more DUs with unknown eligibility because an adult DU member did not contact RTI to begin the screening process. If a DU's eligibility was unknown for web-based data collection, its eligibility status was imputed according to the historic DU eligibility rate in

---

<sup>30</sup> Center for Behavioral Health Statistics and Quality. (forthcoming). *2020 National Survey on Drug Use and Health (NSDUH) methodological resource book, Section 8: Data collection final report*. Rockville, MD: Substance Abuse and Mental Health Services Administration.

the state where the DU was located. DUs that were imputed to be ineligible were excluded from the weighting process before the screening dwelling unit nonresponse adjustment.

Because of the COVID-19 pandemic, Quarter 4 of 2020 (i.e., October to December) marked the first time that NSDUH used web-based interviewing. However, the number of adult web respondents in Quarter 4 who provided usable information on their substance use but did not complete the mental health or later questions (i.e., “break-offs”) raised concerns about the 2020 mental health estimates for adults. Specifically, mental health estimates for adults could be biased if the characteristics of adult respondents who broke off the interview without completing the mental health questions differed from the characteristics of respondents who completed these questions. To reduce the potential for bias, a set of “break-off analysis weights” was developed for the full restricted-use analytic file to analyze unimputed outcome variables in the mental health module and subsequent modules for Quarter 1 and Quarter 4 separately and for combined Quarters 1 and 4. For details on these break-off analysis weights, refer to Section 6.2.2.3 in the 2020 methodological summary and definitions. Due to potential disclosure risk, the break-off analysis weights are not included in the 2020 PUF. Caution should be used for analyzing the outcomes in the mental health and subsequent sections of the codebook and for drawing conclusions using the main PUF analysis weights (ANALWTQ1Q4\_C).

For the 2020 PUF, only the main person-level analysis weights (ANALWTQ1Q4\_C) for combined Quarters 1 to 4 data analysis are maintained on the file. The variable QUARTER is not included on the PUF, and the quarter-specific weight variables are not included on the PUF, so analysis for separate quarters cannot be done. The person-level analysis weights on the PUF (ANALWTQ1Q4\_C) are created from doing additional weight calibration on the main analytic weight (ANALWT\_Q1Q4). For details on how the main analytic weight ANALWT\_Q1Q4 is produced, refer to Section 6.2.2.1.2 in the 2020 methodological summary and definitions. For details on how ANALWTQ1Q4\_C is produced, see Section 16, Public Use File Weight Calibration.

## 10. Usable Interviews

A key step in the data processing procedures established the minimum item response requirements for interviews to be retained for weighting and further analysis (i.e., “usable” data). These procedures were designed to eliminate data from interviews with unacceptable levels of item nonresponse (i.e., missing data), thereby using data from interviews with lower levels of missing data and reducing the amount of statistical imputation needed for any given record.

The usability criteria established for NSDUH were based on the completeness of information respondents provided about their lifetime use or nonuse of different substances. In NSDUH, respondents were asked more detailed questions about different substances only if they reported lifetime use of that substance (or lifetime use of one or more drugs within a broader category, such as hallucinogens) on an initial “gate” question; these questions are subsequently referred to as gate questions because a report of use opens the “gate” to the administration of additional questions, and other reports that do not explicitly indicate use close

the “gate.”<sup>31</sup> Consequently, whether a NSDUH respondent was a user or nonuser of the substances of interest could be readily determined by reviewing the respondent’s answers to the gate question on lifetime use of that substance (or category of substances).

For a NSDUH record to be considered usable, both of the following requirements must be met:

1. The lifetime cigarette question CG01 (i.e., “Have you ever smoked part or all of a cigarette?”) had to have been answered as “yes” or “no.” This requirement was set so that lifetime use or nonuse would be fully defined for at least one substance. Consequently, data about lifetime use or nonuse of cigarettes could be used in subsequent statistical imputations for other substances where lifetime use or nonuse was undefined.
2. Responses to questions on at least nine (9) of the following additional substances had to contain information about use or nonuse: (a) smokeless tobacco, (b) cigars, (c) alcohol, (d) marijuana, (e) cocaine (in any form), (f) heroin, (g) hallucinogens, (h) inhalants, (i) methamphetamine, (j) pain relievers, (k) tranquilizers, (l) stimulants (i.e., independent of methamphetamine), and (m) sedatives. Crack cocaine was not included in the usability criteria because the logic for asking about crack cocaine was dependent upon the respondent having answered the lifetime cocaine question as “yes.” Although the CAI instrument also asked about pipe tobacco, this tobacco product was not included in the usability criteria because there was only one other question about pipe tobacco in addition to the lifetime pipe tobacco use question.<sup>32</sup>

The usability criterion for smokeless tobacco through methamphetamine was that lifetime use or nonuse must be determined. For the “multiple gate” sections for hallucinogens and inhalants, at least one gate question in the series for that section was required to have an answer of “yes” or “no.”<sup>33</sup> Any of the following allowed the prescription drug data to count toward usability:

- Past year use of at least one specific prescription drug in a category (e.g., pain relievers) was reported.
- Lifetime use or nonuse of any prescription drug in the category was reported.

---

<sup>31</sup> In all substance use sections except those pertaining to hallucinogens, inhalants, pain relievers, tranquilizers, stimulants, and sedatives, the logic for asking more detailed questions about use of that drug was based on the answer to a single “yes/no” question (e.g., “Have you ever, even once, used marijuana or hashish?”).

<sup>32</sup> For a more detailed discussion of the development of the usable criteria requirements, see the following reference: Kroutil, L., & Myers, L. (2002). Development of editing rules for CAI substance use data. In J. Gfroerer, J. Eyerman, & J. Chromy (Eds.), *Redesigning an ongoing national household survey: Methodological issues* (HHS Publication No. SMA 03-3768, pp. 85-109). Rockville, MD: Substance Abuse and Mental Health Services Administration, Office of Applied Studies.

<sup>33</sup> For hallucinogens and inhalants, the logic for asking more detailed questions about use of that category of drugs was based on respondents’ answers to multiple “yes/no” questions about the lifetime use or nonuse of specific drugs within that category (e.g., lifetime use or nonuse of the following specific hallucinogens: lysergic acid diethylamide (LSD); phencyclidine (PCP); peyote; mescaline; psilocybin/mushrooms; Ecstasy or “Molly” [3,4-methylenedioxymethamphetamine (MDMA)]; ketamine; dimethyltryptamine (DMT), alpha-methyltryptamine (AMT), or “Foxy”; *Salvia divinorum*; or “any other” hallucinogen).

- Past year nonuse of *all* specific prescription drugs was reported, regardless of whether lifetime use or nonuse can be determined.

The interview also included follow-up probes for respondents who initially refused to answer a gate question or an entire series of gate questions. Follow-up probes were included in the following sections that were relevant to the usability rules: cigarettes, smokeless tobacco, cigars, alcohol, marijuana, cocaine, heroin, specific hallucinogens (i.e., LSD, PCP, Ecstasy/"Molly" [MDMA]), any use of inhalants, and methamphetamine. If respondents changed their initial refusal to a response of "yes" or "no," they were considered to have provided usable data to that drug's gate information.

In addition, the CAI program terminated interviews during the initial demographics questions if respondents were ineligible for the survey (i.e., younger than age 12 or on active duty in the U.S. military) or if respondents did not provide their date of birth or age. Also, interviews were not able to proceed if certain initial questions, such as gender and state of residence, were not answered by the interviewer. These ineligible or incomplete interviews did not meet the usability criteria because the interviews were terminated before the respondents were asked the first cigarette use question.

## **11. Logical Editing**

For selected key variables, response data were reviewed to identify and address inconsistent data among related variables or to replace missing data with nonmissing values. The routing logic in the CAI instrument reduced the opportunities for respondents to give inconsistent answers by skipping respondents past questions that did not apply to them. The occurrence of inconsistent data was reduced further through the use of consistency checks built into the CAI program that prompted respondents to resolve inconsistencies between related items. Nevertheless, there still were limited situations in which respondents could answer one question in a manner inconsistent with their answer to a previous question.

Logical editing was the first step in processing many of the variables on the file. This procedure used data within a respondent's record to identify and address inconsistencies among related variables within a given section of the interview (e.g., within the hallucinogens section). As part of this procedure, variables were identified that had been legitimately skipped because the condition(s) for asking the questions did not apply. As a general principle, responses from one section (e.g., hallucinogens) were not used to edit variables in another section (e.g., inhalants).<sup>34</sup> For this reason, data in one section may not be completely consistent with data in other sections. Subsequent discussion about editing in this section focuses on key substance use variables.

---

<sup>34</sup> One exception to the principle of not editing across questionnaire sections involved situations in which responses in one section governed whether respondents were asked questions in another section. For example, if respondents reported never using heroin but they received substance abuse treatment in the past 12 months, they were not asked questions in the drug treatment section about current or past year treatment for heroin. Consequently, codes could be assigned to indicate that the respondents skipped out of the heroin treatment questions because they had never used heroin.

## **11.1 Editing Procedure for Tobacco through Methamphetamine**

This section provides an overview of editing procedures for variables pertaining to substances other than prescription drugs. Procedures for prescription drugs are described separately in Section 11.2 because the questionnaire is structured differently for the prescription drug questions.

In sections of the interview for tobacco, alcohol, marijuana, cocaine (including crack cocaine), heroin, hallucinogens, inhalants, and methamphetamine, logical editing and processing of substance use variables first involved identifying whether respondents had ever used or never used the substance of interest. Determining whether respondents had ever used a given substance (or any substance within a broader category, such as hallucinogens) included identifying situations in which respondents initially refused to answer a question about their lifetime use of a substance but then changed their answer to “yes” or “no” on follow-up. If respondents did not provide sufficient information about their use or nonuse of a particular substance (or category of substances, such as hallucinogens), their final status was assigned through statistical imputation procedures. If values pertaining to lifetime use or nonuse of a given substance were changed through the editing procedures, this editing was indicated through special codes that indicated a response was logically inferred; documentation for these codes includes the phrase “LOGICALLY ASSIGNED.” For example, if respondents did not report lifetime use of LSD (a specific hallucinogen) in question LS01a, but they specified lifetime use of it as some other hallucinogen they used, then they were logically inferred to be lifetime users of LSD.

After lifetime use or nonuse of a given substance had been determined as part of the editing procedures, edits were implemented for the variables that established when respondents last used a substance of interest. These edited recency-of-use variables were the precursors for the final, imputed measures that established the prevalence of use in the past 30 days, past 12 months, and lifetime.

The interview included follow-up probes for respondents who were lifetime users of a given substance but did not know or refused to report when they last used it. Respondents who initially did not know when they last used a substance were asked to give their “best guess” of when they last used it. Respondents who initially refused to report when they last used a substance were asked to reconsider answering the question. If respondents changed their initial answer of “don’t know” or “refused” in response to these probes, the editing procedures incorporated data from these probes into the final, edited recency-of-use variables. For example, if respondents initially refused to report when they last used a substance but then reported last using it more than 30 days ago but within the past 12 months in response to a follow-up probe, their edited recency indicated use in that period, in the absence of any information inconsistent with what they reported in the probe (see below).

For substances other than prescription drugs, situations were identified and flagged in which there were inconsistencies between a respondent’s answer to a substance’s recency question (or the answer in a follow-up probe) and other data in that section. For example, it would be inconsistent for a respondent to report last using a substance “more than 12 months ago” but also to report having first used it at his or her current age. In this example, the edited recency variable was set to a value of 9 (see documentation in the paragraph below), and the

edited variable for the age at first use was set to the “bad data” code for missing data (see Section 11.3, Standard Code Conventions). These inconsistencies then were addressed by statistically imputing final values for the affected recency variable and the other variable(s) where the data were inconsistent with the respondent’s original answer to the recency question.

If values pertaining to the period when respondents last used a substance were changed through the editing procedures, special codes were assigned to indicate these edits had been done. The documentation for these codes included the phrase “LOGICALLY ASSIGNED.” For example, a code of 8 in a substance’s recency-of-use variable means “Used at some point in the past 12 months LOGICALLY ASSIGNED.” Specifically, if a respondent reported using a substance more than 30 days ago but within the past 12 months but other data suggested the respondent may have used the substance more recently, this code of 8 indicated that at least it could be inferred the respondent was a user in the past 12 months (and potentially more recently). Similarly, a code of 9 (“Used at some point in lifetime LOGICALLY ASSIGNED”) indicated the respondent was potentially a user in any period asked about for that particular substance, including the past 30 days. In particular, respondents were assigned a code of 9 if they initially answered “don’t know” or “refused” to a substance’s recency question and continued on follow-up to answer “don’t know” or “refused” regarding when they last used it.

## **11.2 Editing Procedure for Prescription Drug Variables**

Respondents first were asked a series of screening questions about *any* use of specific prescription drugs (pain relievers, tranquilizers, stimulants, and sedatives) in the past 12 months (i.e., use or misuse) or any lifetime use if they did not report past year use. Respondents were asked about misuse in the past year of any of the specific prescription drugs they reported using in that period.

Consistent with the general editing principles described previously, an important component of editing the prescription drug variables involved determining whether respondents used (or misused) prescription drugs in their lifetime or in a particular period within their lifetime (e.g., within the past 12 months). If respondents reported any use of prescription drugs, the possibilities for most recent use were (1) use within the past 12 months, (2) use more than 12 months ago (i.e., if respondents explicitly reported they used no prescription drugs within that category within the past 12 months but they reported lifetime use), and (3) use at some point in the respondent’s lifetime (i.e., if respondents reported lifetime use of any prescription drug in a given category but they had missing data for use in the past year of specific prescription drugs).

Because of the structure of the prescription drug questions, respondents were not asked a specific question for their most recent misuse of any prescription drug in that category. Rather, variables for the most recent misuse of prescription pain relievers, tranquilizers, stimulants, and sedatives were created from respondents’ answers to questions about the misuse of any prescription drug in the category in the past 30 days, misuse of specific prescription drugs in a given category in the past 12 months, and lifetime misuse of any prescription drug in the category. For example, if respondents reported misuse of one or more specific prescription drugs in a given category in the past 12 months and they reported they did not misuse any prescription drug in that category in the past 30 days, then it could be inferred the most recent misuse for that prescription drug category occurred more than 30 days ago but within the past 12 months.

As with other substances described in the previous section, respondents could provide “indefinite” information on when they last misused prescription drugs. For example, if respondents reported misuse of one or more specific prescription drugs in the past 12 months but they did not know or refused to report whether they misused any prescription drug in the past 30 days, it could be inferred these respondents misused prescription drugs in the past 12 months and potentially in the past 30 days. In these situations, an indefinite value for the most recent period of misuse was assigned to the variables created for the most recent misuse of pain relievers, tranquilizers, stimulants, and sedatives (e.g., “Used at some point in the past 12 months LOGICALLY ASSIGNED”), and a final, specific value was statistically imputed.

Also, respondents were logically inferred to have misused (or used) a specific prescription drug in the past 12 months if they did not report misuse of that drug in the past 12 months but they specified misuse of that drug as “some other drug” within that category (e.g., any other prescription pain reliever) that they misused in the past 12 months. In addition, respondents were instructed not to report use or misuse of over-the-counter (OTC) drugs available without a prescription. Therefore, respondents whose reported past year misuse involved only OTC drugs were logically inferred not to have misused any prescription drug in that category in the past 12 months.

Details of the editing procedures for the drug use variables in 2020 will appear in the 2020 NSDUH methodological resource book, which will be available in 2022.

### **11.3 Standard Code Conventions**

Generally, the following codes have the same (or consistent) meanings across all variables. Exceptions are noted in the documentation for individual variables.

91 or 991 or 9991, etc.	= NEVER USED [DRUG(s) OF INTEREST]
93 or 993 or 9993, etc.	= USED [DRUG] BUT NOT IN THE PERIOD OF INTEREST
94 or 994 or 9994, etc.	= DON'T KNOW
97 or 997 or 9997, etc.	= REFUSED
98 or 998 or 9998, etc.	= BLANK (i.e., not answered; not asked the question)
99 or 999 or 9999, etc.	= LEGITIMATE SKIP

The following analogous codes also were assigned as part of the logical editing process. Exceptions are noted in the documentation for specific variables.

81 or 981, 9981, etc.	= NEVER USED [DRUG(s) OF INTEREST] Logically assigned
83 or 983, 9983, etc.	= USED [DRUG] BUT NOT IN THE PERIOD OF INTEREST Logically assigned
85 or 985, 9985, etc.	= BAD DATA Logically assigned (i.e., usually inconsistent with other data)
89 or 989, or 9989, etc.	= LEGITIMATE SKIP Logically assigned

The codes of 81, 83, 85, and 89 were given values in the 80s to signify that existing values were overwritten during editing. For example, if a respondent was somehow routed into the youth experiences section but that respondent was subsequently classified as being 18 or older, any answer the respondent gave in the youth experiences section was overwritten with codes of 89 (or 989, etc.). These codes signify this adult respondent logically was not eligible to be asked the youth experiences questions.

Codes of 85 (or 985, etc.), 94 (or 994, etc.), 97 (or 997, etc.), and 98 (or 998, etc.) are codes for missing data. In particular, codes of 98 (i.e., blank) could occur in the data for the following reasons:

- The respondent broke off the interview before reaching a particular question or section.
- In situations where respondents were asked to specify something, such as the name of some other drug they had used, respondents typed only blank spaces.
- The CAI program skipped the respondent past a question, but there was some uncertainty as to whether the skipped question applied or did not apply to the respondent (e.g., if subsequent questions about a drug were skipped because the respondent did not know whether he or she ever used that drug).

## **12. Statistical Imputation**

Statistical imputation refers to the substitution of acceptable estimated values for missing values. These imputed values cannot be directly distinguished from nonimputed values. Using statistical imputation, missing data were replaced with nonmissing values for selected variables. These variables can be identified in the codebook by their labels, within which can be found the words “IMPUTATION REVISED” or abbreviations such as “IMP REV.” In addition, most imputation-revised variables have names with the prefix “IR.” (Although no missing data are possible for gender, the “IR” prefix for IRSEX is maintained for continuity with past years.) Associated indicator variables tell the user which values are imputed and which ones are not. These indicator variables have the words “IMPUTATION INDICATOR” or abbreviations such as “IMP IND” in their labels and are identified with the prefix “II.” For some imputation-revised variables, additional imputation indicators are available, identified with the prefix “II2,” giving more details about the source of the imputed or logically assigned value. In most cases, the imputation-revised variable can be traced to a specific question in the questionnaire. However, the imputation-revised variable occasionally corresponds to an edited variable derived from several questions in the questionnaire.

With the 2020 survey, the drug use variables that underwent imputation were recency of (mis)use (i.e., “misuse” or “use”), frequency of use in the past 12 months, frequency of (mis)use in the past 30 days, past year initiation status, age at first (mis)use, and date of first (mis)use.

Age at first daily cigarette use and binge drinking frequency<sup>[35](#)</sup> in the past 30 days were also drug use variables that underwent statistical imputation. Beginning in 2015, drug use variables undergoing imputation also included the DSM-IV measures of substance dependence and abuse (use disorder) for hallucinogens, inhalants, methamphetamine, and prescription drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives).<sup>[36](#)</sup> Beginning in 2020, drug use variables undergoing imputation also included the DSM-5 measures of SUD and disorder severity for alcohol and illicit drugs as well as recency-of-use measures for any vaping, nicotine or tobacco vaping, synthetic marijuana, synthetic stimulants, and kratom.

Imputation of missing values in these drug use variables was accomplished using two imputation procedures developed specifically for NSDUH. The first method, predictive mean neighborhood (PMN), has been used to impute missing values in the survey since 1999 and is a combination of model-assisted and nearest neighbor hot-deck imputation methods. The second imputation method used to impute missing values for some drug use and SUD variables, modified predictive mean neighborhood (modPMN), is so named because it includes both simplifications and modifications to the PMN methodology and has been used for selected variables on NSDUH since 2015. The modPMN procedure uses the model-assisted imputation methodology of the PMN approach while also permitting the user to cycle through a set of related variables multiple times. The PMN method also was used in the 2020 survey to impute missing values in the demographic, employment status, immigrant status, income, insurance, and roster-derived household composition variables, as well as variables associated with responding pairs. One group of variables for which neither the PMN method nor the modPMN method was used is nicotine dependence. Instead, a weighted least squares regression was used to obtain continuous predicted means, which in turn were used directly as imputed values for this set of variables. More details on the methods used for imputation can be found in the 2020 NSDUH methodological resource book, which will be available in 2022.

For all imputation-revised variables except those associated with nicotine dependence, the levels within the variables are limited to the valid responses in the interview itself. If neither editing nor imputation was required for any of these variables, the levels for the edited and imputation-revised variables are the same, with each level corresponding to a valid interview response. If an edited variable has a logically assigned value for which no imputation was required, that logically assigned value was converted to the associated valid interview response in the imputation-revised variable. Finally, levels in the edited variable not corresponding to a valid interview response indicate the information available for that respondent was incomplete and, consequently, imputation was required. In the imputation-revised variable, these levels were replaced by imputed values corresponding to valid interview responses, which were made consistent with any preexisting information related to that variable. Examples of levels indicating incomplete information include “bad data,” “don’t know,” and “refused.” Also, in the case of recency of (mis)use, some levels in the edited variable describe a more general recency

---

<sup>[35](#)</sup> Binge alcohol use is defined as drinking five or more drinks on the same occasion for males and drinking four or more drinks on the same occasion for females (i.e., at the same time or within a couple of hours of each other) on at least 1 day in the past 30 days. Heavy alcohol use is defined as drinking five or more drinks on the same occasion for males or drinking four or more drinks of the same occasion for females on each of 5 or more days in the past 30 days; all heavy alcohol users are also binge alcohol users.

<sup>[36](#)</sup> DSM-IV measures of substance dependence and abuse for other substances continue to be zero-filled (i.e., missing data are treated as negative responses) to maintain consistency with previous years.

(e.g., misused at some point in the past 12 months) than was designated from a valid interview response, which, in the imputation-revised variable, were replaced by imputed values consistent with the general recency level.

## 12.1 Imputation Indicators

For each variable including imputed values, concomitant indicator variables distinguish imputed from nonimputed values. These associated variables have names nearly identical to the imputation-revised variables, except that the IR prefix was replaced by an II or an II2. In general, the imputation indicator variables with the II prefix have three levels:

- 1 = From interview
- 2 = Logically assigned
- 3 = Statistically imputed

These levels indicate whether the imputation-revised variable's value originated from interview responses, was logically assigned in the editing process, or was imputed. In some cases, the routing inherent in NSDUH prevented respondents from answering certain questions because of their responses to previous questions. For the drug use variables, if a respondent had been skipped out of a question, the response in the imputation-revised variable is coded as "never used" or is coded to indicate the respondent had not used in the relevant time period. For other variables where this occurred, the imputation-revised variable has a level with a label indicating a legitimate skip. The imputation indicators associated with these variables also have an additional level, which likewise has a label indicating a legitimate skip. Typically, this level is given as 9 (= Legitimate skip), often with an accompanying explanation for the skip.

Variables having an additional set of imputation indicators, as denoted by the prefix "II2," are IRWRKSTAT18, IRWRKSTAT, and the recency and frequency of drug use variables. Beginning in 2015 for smokeless tobacco, inhalants, hallucinogens, Ecstasy, ketamine, DMT/AMT/Foxy, *Salvia divinorum*, methamphetamine, and prescription drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives), only one set of imputation indicators denoted by the prefix "II" was created. Similarly, beginning in 2020, only one set of imputation indicators denoted by the prefix "II" was created for any vaping, nicotine or tobacco vaping, kratom, synthetic marijuana, and synthetic stimulants. For this set of drugs, these imputation indicators contain the more detailed breakdown of statistically imputed cases typically found in the variables with the prefix "II2" for all remaining drugs as described below. For IRWRKSTAT18 and IRWRKSTAT, the II2 variables provide more details about the constraints on imputed values, where the legitimate skip levels are equivalent to those given by the II variables. The drug use II2 variables are a result of the implementation of the flag-and-impute editing procedures on the recency-of-use data. Details on these editing procedures are given in Section 11, Logical Editing. With these editing procedures, inconsistent responses in the recency-of-use variables were replaced by more general, consistent responses. Subsequently, the specific responses then were imputed. If the response from a recency-of-use variable was considered partially known, such as past year use of a given drug with the more specific recency unknown, imputed values had to be limited to what was consistent with this incomplete information. The types of partial information available for a given variable are as follows:

- 8 = Used at some point in the past 12 months LOGICALLY ASSIGNED
- 9 = Used at some point in lifetime LOGICALLY ASSIGNED
- 14 = Used more than 12 months ago LOGICALLY ASSIGNED
- 19 = Used more than 30 days ago LOGICALLY ASSIGNED
- 29 = Used more than 30 days ago but in the past 3 years LOGICALLY ASSIGNED
- 39 = Used within the past 3 years LOGICALLY ASSIGNED
- 83 = Did not misuse within the past 12 months, lifetime misuse unknown  
LOGICALLY ASSIGNED

Four of these levels (14, 19, 29, and 39) are for tobacco product use only, and the last level (83) is for pain relievers, tranquilizers, stimulants, and sedatives only. In the imputation indicator for recency of drug use variables, level 3 indicates statistical imputation, but no detail is given regarding any available partial information. The II2 variable breaks out the II level 3 into the following levels for nonprescription drugs:

- 3 = Statistically imputed data - lifetime use imputed
- 4 = Statistically imputed data - edited recency = 9
- 5 = Statistically imputed data - edited recency = 8
- 6 = Statistically imputed data - edited recency = 19
- 7 = Statistically imputed data - edited recency = 14
- 8 = Statistically imputed data - edited recency = 29
- 9 = Statistically imputed data - edited recency = 39

For the prescription drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives), the levels of the imputation indicator variables for recency of misuse also contained information on whether the recency variable associated with any use in the past year or lifetime required imputation. For these drugs, the statistically imputed cases are broken out into the following levels to account for this additional source of information:

- 3 = Statistically imputed data - recency of any use imputed
- 4 = Statistically imputed data - recency of any use known
- 5 = Statistically imputed data - edited recency = 9
- 6 = Statistically imputed data - edited recency = 8
- 7 = Statistically imputed data - edited recency = 83

## **12.2 Constraints and Consistency**

The imputation of missing values in the demographic and drug use variables was subject to numerous constraints to ensure imputed values would be consistent with preexisting, nonmissing values. For multivariate analyses, the imputation-revised variables should be used as

long as these variables all come from the same section of the interview. On the other hand, no attempt was made to ensure consistency between the imputation-revised variables from different sections of the questionnaire or between variables that undergo imputation and those that do not. For example, the question on the most recent use of cocaine (CCLAST3) from the cocaine section of the questionnaire undergoes imputation, and every attempt is made to ensure this variable is consistent with other nonmissing information from the same section of the questionnaire, such as age at first use and frequency of use. However, it is possible for the imputation-revised cocaine recency variable (IRCOCRC) to be inconsistent with the question on the most recent use of cocaine with a needle (SD06), which does not undergo imputation, from the special drugs section of the codebook. Therefore, for analyses of relationships requiring imputation-revised variables from multiple sections of the interview or a combination of imputation-revised variables and variables that do not undergo imputation, simultaneous use of these variables may not be appropriate.

### **13. Variance Estimation of Estimated Numbers of Individuals**

Prevalence rates are the proportions of the population who exhibit characteristics of interest (such as substance use). Let  $\hat{p}_d$  represent the prevalence rate of interest for domain  $d$ . Then  $\hat{p}_d$  would be defined as the ratio

$$\hat{p}_d = \frac{\hat{Y}_d}{\hat{N}_d},$$

where  $\hat{Y}_d = \sum_{i \in S} w_i \delta_i y_i$ , which represents the estimated number of individuals with the characteristic of interest in domain  $d$ ;  $\hat{N}_d = \sum_{i \in S} w_i \delta_i$ , which represents the estimated total number of individuals in the domain  $d$ ;  $S$  represents the sample;  $w_i$  represents the analysis weight;  $\delta_i$  represents an indicator variable defined as 1 if the  $i$ th sample unit is in domain  $d$  and is equal to 0 otherwise; and  $y_i$  represents an indicator variable defined as 1 if the  $i$ th sample unit exhibits the characteristic of interest and is equal to 0 otherwise.

The sampling error of an estimate is the error caused by the selection of a sample instead of conducting a census of the population. The sampling error may be reduced by selecting a large sample and/or by using efficient sample design and estimation strategies, such as stratification, optimal allocation, and ratio estimation. The use of probability sampling methods in NSDUH allows estimation of sampling error from the survey data. The standard errors (SEs, which are the square roots of the variances) are used to identify unreliable estimates and to test for the statistical significance of differences between estimates.<sup>37</sup>

---

<sup>37</sup> Caution should be used when comparing estimates between 2020 and prior years because of the methodological changes for 2020.

Suitable software packages, such as SUDAAN<sup>®</sup>,<sup>38</sup> can be used to calculate direct estimates of  $\hat{Y}_d$  and  $\hat{N}_d$  (and, therefore,  $\hat{p}_d$ ) and also can be used to estimate their respective SEs. Although SEs of the estimates of means and proportions can be calculated appropriately in software (such as SUDAAN) using a Taylor series linearization approach, SEs of the estimates of totals may be underestimated in situations where the domain size is poststratified to data from the U.S. Census Bureau.

When the domain size,  $\hat{N}_d$ , is free of sampling error because the domain size has been fixed (see below), the following formula is an alternative to using SUDAAN to estimate the SE for the total number of individuals with a characteristic of interest (e.g., substance users):

$$\text{SE}(\hat{Y}_d) = \hat{N}_d \text{SE}(\hat{p}_d).$$

This alternative SE estimation method is theoretically correct when the domain size estimates,  $\hat{N}_d$ , are fixed (i.e., among those domains forced to match their respective U.S. Census Bureau population estimates through the weight calibration process).<sup>39</sup>

In these situations,  $\hat{N}_d$  is not subject to a sampling error induced by the NSDUH design. For an estimated number,  $\hat{Y}_d$ , where the domain  $\hat{N}_d$  is not fixed (i.e., where domain size estimates are not forced to match the U.S. Census Bureau population estimates), this alternative SE estimation method still may provide a good approximation if it can be assumed that the sampling variation in  $\hat{N}_d$  is negligible relative to the sampling variation in  $\hat{p}_d$ . This is a reasonable assumption for many situations in this study.

For some subsets of domain estimates, using this alternative SE estimate method where domain sizes are not fixed yielded an underestimate of the SE of a total because  $\hat{N}_d$  was subject to considerable variation. Because of this underestimation, the alternative SE estimation method was not implemented when  $\hat{N}_d$  was not fixed.

A “mixed-method” approach can be used to improve the accuracy of SEs and to better reflect the effects of poststratification on the variance of total estimated numbers of individuals. This approach assigns the method of SE calculation to domains (i.e., subgroups for which the estimates were calculated) within tables so that all estimates among a select set of domains with fixed  $\hat{N}_d$  were calculated using the alternative SE estimate method above, and all other estimates were calculated directly in SUDAAN, regardless of what the other estimates are within the same table. The use of such SEs for the estimated number of individuals did not affect the SE estimates for the corresponding proportions because all SEs for means and proportions are

calculated directly in SUDAAN. [Table 1](#) includes the domains that should utilize the alternative SE method due to fixed  $\hat{N}_d$  for the 2020 PUF.

**Table 1. Demographic Domains for the Public Use File That Should Use the Alternative Standard Error Estimation Method for Calculating the Standard Errors of the Estimated Number of Individuals, Totals: 2020**

Main Effect	Two-Way Interaction
<b>Age Group</b>	
12-17	
18-25	
26-34	<b>Age Group × Gender</b> (e.g., Males Aged 12-17)
35+	
Collapsed Age Categories <sup>1</sup>	
<b>Gender</b>	
Male	
Female	
<b>Race/Ethnicity</b>	
Hispanic or Latino	
Not Hispanic or Latino, White <sup>2</sup>	

NSDUH = National Survey on Drug Use and Health; SE = standard error.

Note: The alternative SE estimation method for the estimated number of individuals (totals),  $SE(\hat{Y}_d) = \hat{N}_d SE(\hat{p}_d)$ , is applied when the domain size estimates,  $\hat{N}_d$ , are among those forced to match their respective U.S. Census Bureau population estimates through the weight calibration process.

Note: The alternative SE estimation method does not affect the SEs for the corresponding means and proportions. These latter SEs are calculated directly in SUDAAN®, whereas the alternative SE estimation method is computed outside of SUDAAN using the formula provided in the first note. See the following reference: RTI International. (2013). *SUDAAN® language manual, Release 11.0.1*. Research Triangle Park, NC: Author.

Note: Domains in this table may appear to be different from those in Table 3.1 of the 2020 NSDUH methodological summary and definitions report because of different adjustments applied to the weights on the public use file. All weights except for the standard analysis weight (ANALWTQ1Q4\_C) were dropped from the public use file. See the following reference: Center for Behavioral Health Statistics and Quality. (2021). *2020 National Survey on Drug Use and Health: Methodological summary and definitions*. Retrieved from <https://www.samhsa.gov/data/>

<sup>1</sup> Main effect age group categories shown in the table can be collapsed to form broader age group categories (e.g., 12 or older, 18 or older, 18 to 34, 12 to 25). Collapsed main effect age group categories and two-way interactions with other main effect demographic domains shown (e.g., males aged 35 or older) also use the alternative SE estimation method because the collapsed main effects will sum to the census totals for the category being defined. However, broader age groups including only a subset of the main effect age groups (e.g., 12 to 20, 21 or older, 15 to 44), age groups finer than the main effect age groups (e.g., 12 and 13, 18 to 20), or two-way interactions of these types of collapsed age categories with other main effect domains (e.g., females aged 15 to 44) should not use the alternative SE estimation method.

<sup>2</sup> This domain is considered a two-way interaction. Thus, any additional domains crossed with Not Hispanic or Latino, White (e.g., Not Hispanic or Latino, Whites aged 18 to 25) represent three-way interactions that do not use the alternative SE estimation method.

## 14. Statistical Significance of Differences

NSDUH data are often used to compare estimates among subdomains or across time. As previously described, the 2020 NSDUH underwent major methodological changes due to COVID-19. If comparisons of 2020 data with prior years of NSDUH data are done, which is not recommended, these changes should be taken into consideration. See the 2020 methodological summary and definitions for more details on methodological changes.

Similar changes in methodology or design in the past led to similar cautions against comparing estimates across the time of the change. Due to the 2002 NSDUH methodology changes, the 2002 data constituted a new baseline for tracking trends in substance use and other measures. As noted previously, it is not considered appropriate to make comparisons of the 2002 and later NSDUH estimates with 2001 and earlier NHSDA estimates to assess changes in substance use over time. If comparisons such as these are made, it is recommended they be interpreted with caution. For a more detailed description of the changes to the 2002 NSDUH methodology, see Appendix C of the *Results from the 2002 National Survey on Drug Use and Health: National Findings*. A partial questionnaire redesign in 2015 caused many estimates to break trends. Further questionnaire updates since 2015 could also affect the comparability of some measures. For the effects of questionnaire changes since 2015 on trends, see the codebook notes for more detailed information.

Besides periods when there have been methodological changes or questionnaire changes, the NSDUH data have been commonly used for comparing estimates across years and between or among subdomains within a given year. Customarily, the observed difference between estimates is evaluated in terms of its statistical significance. Statistical significance is based on the  $p$  value of the test statistic and refers to the probability that a difference as large as that observed would occur due to random variability in the estimates if there were no differences in the prevalence estimates for the population groups being compared. The significance of observed differences is generally reported at the .05 level when the  $p$  value is defined as less than or equal to the designated significance level.

When comparing prevalence estimates, one can test the null hypothesis (no difference between prevalence estimates) against the alternative hypothesis (there is a difference in prevalence estimates) using the standard difference in proportions test expressed as

$$Z = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\text{var}(\hat{p}_1) + \text{var}(\hat{p}_2) - 2 \text{cov}(\hat{p}_1, \hat{p}_2)}},$$

where  $\hat{p}_1$  = first prevalence estimate,  $\hat{p}_2$  = second prevalence estimate,  $\text{var}(\hat{p}_1)$  = the estimated variance of first prevalence estimate,  $\text{var}(\hat{p}_2)$  = the estimated variance of second prevalence estimate, and  $\text{cov}(\hat{p}_1, \hat{p}_2)$  = the estimated covariance between  $\hat{p}_1$  and  $\hat{p}_2$ . Note that the first and second prevalence estimates may take the form of prevalence estimates from two different survey years (e.g., 2018 and 2019, respectively),<sup>40</sup> prevalence estimates from sets of combined

---

<sup>40</sup> This statement applies to years prior to 2020 because testing is not recommended between 2020 NSDUH estimates and prior year estimates.

survey data (e.g., 2016-2017 annual averages and 2018-2019 annual averages, respectively),<sup>41</sup> or prevalence estimates for populations of interest within a single survey year. For more information on the various types of tests, see Chapter 7 in the 2019 statistical inference report.<sup>42</sup>

Under the null hypothesis,  $Z$  is asymptotically distributed as a normal random variable. Therefore, calculated values of  $Z$  can be referred to as the unit normal distribution to determine the corresponding probability level (i.e.,  $p$  value). Because the covariance term between the two estimates is not necessarily zero, SUDAAN may be used to compute estimates of  $Z$  along with the associated  $p$  values such that the covariance term is calculated by taking the sample design into account. A similar procedure and formula for  $Z$  is used for testing between estimated totals rather than prevalence rates.

When comparing outcomes of interest for all data points across all years of interest (e.g., 2002 to 2019 for past month cigarette use),<sup>43</sup> linear and quadratic trend testing can be conducted using SUDAAN. Linear trend testing indicates whether estimates have decreased, increased, or remained steady over the period of interest. Quadratic trend testing indicates whether estimates have leveled off or changed direction over the period of interest. For more information on computing linear trend tests using 2019 data and prior years, see the 2019 statistical inference report.

Statistical tests can also be conducted among population subgroups within a single year (i.e., between males and females in 2020). When comparing population subgroups defined by three or more levels of a categorical variable, log-linear chi-square tests of independence of the subgroup and the prevalence variables should be conducted first to control the error level for multiple comparisons. If Shah's Wald  $F$  test (transformed from the standard Wald chi-square and computed in SUDAAN) indicates overall significant differences, the significance of each particular pairwise comparison of interest should be tested using SUDAAN analytic procedures to properly account for the sample design.

If SUDAAN is not available to compute the significance testing, using published estimates can provide similar testing results. When comparing prevalence rates shown with standard errors,  $t$  tests that assume independence for the difference of proportions can be performed and usually will provide the same results as tests performed in SUDAAN. However, where the  $p$  value is close to the predetermined level of significance, results may differ for two reasons: (1) the covariance term is included in the SUDAAN tests, whereas it is not included in  $t$  tests that assume independence; and (2) the reduced number of significant digits shown in the published estimates may cause rounding errors in the  $t$  tests.

Although not generated in all NSDUH publications, some publications do include sampling error in the form of 95 percent confidence intervals (CIs). CIs for NSDUH are

---

<sup>41</sup> See Section 18, Special Types of Analyses, for more information and considerations for pooling 2020 data with prior year NSDUH data.

<sup>42</sup> Center for Behavioral Health Statistics and Quality. (2020). *2019 National Survey on Drug Use and Health (NSDUH) methodological resource book, Section 13: Statistical inference report*. Rockville, MD: Substance Abuse and Mental Health Services Administration.

<sup>43</sup> This statement applies to years prior to 2020 because testing is not recommended between 2020 NSDUH estimates and prior year estimates.

computed using degrees of freedom and critical values of the *t*-distribution, which will change, dependent on which sample of data is being analyzed. For more information about computing CIs and degrees of freedom, see Chapters 8 and 6, respectively, in the 2019 statistical inference report. In terms of testing for differences between prevalence rates shown with 95 percent CIs, it is important to note that two overlapping 95 percent CIs do not necessarily imply their rates are statistically equivalent at the 5 percent level of significance.<sup>44</sup>

## 15. Confidentiality of Data

To protect the confidentiality of respondents to the 2020 NSDUH, the full analytic file of 36,284 individuals was treated using a statistical disclosure limitation method called MASSC,<sup>45,46,47</sup> which consists of the following four major steps: Micro Agglomeration, optimal probabilistic Substitution, optimal probabilistic Subsampling, and optimal sampling weight Calibration. All directly identifying information (such as name, phone number, and address) on the file was eliminated. In addition, census region, state, and other geographic identifiers were removed. Moreover, the household link between respondents from the same household was not included in the PUF. Specifically, for 2020, factors like having significant reduction in sample size due to the COVID-19 pandemic, having different modes in data collection (i.e., in-person and web mode interviews), and conducting the CVS, have required additional treatment to minimize disclosure risk and to adequately protect respondents' confidentiality. For this purpose, the variable QUARTER and all variables that would reveal quarter information (e.g., variables asked only in Quarter 1 or Quarter 4) have been removed from the file. Additionally, the variable MODE was not retained on the PUF. As noted in prior sections, all COVID-19-related variables and all CVS-related variables have been excluded from the PUF.

All other variables on the file were reviewed for the possibility of identifying a respondent by combining a number of variables at one time. Variables considered to have a high potential of personal identification, as well as a high value for analysis, were treated by standard procedures of categorization, top-and-bottom coding, and local suppression if deemed risky. Using the selected key identifying variables, the data were partitioned into risk strata in the micro agglomeration step to control for the level of treatment based on the records' risk status in the

Alexandria, VA: American Statistical Association.

subsequent MASSC steps. In addition, two other techniques were used in MASSC to introduce sufficient uncertainty for anyone who attempted to identify individuals and their confidential responses. First, on a random basis, a sample of records was drawn, and variables were substituted from a similar donor record. This step, referred to as substitution, introduces uncertainty about the identity of a record in the database. This process makes it difficult for an intruder to be certain that any record corresponds to a specific individual because some of the variables used to identify the record may have come from other individuals. Second, a portion of the records was randomly removed from the file to reduce the probability of determining that any known respondent was in the PUF. This step, referred to as subsampling, introduces further uncertainty about the presence of a target record in the database. The result is that there is a very small probability of identifying an individual from the file.

Substitution and subsampling were done while simultaneously constraining the resultant file to a minimal increase in bias and a minimal decrease in precision for numerous estimates of drug use prevalence across a number of domains. In addition, the weights on the final file were recalibrated to known totals from the full restricted-use analytic file so as to minimize the decrease in precision owing to the two techniques noted above (for details, see Section 16, Public Use File Weight Calibration). Under the MASSC framework, both disclosure risk and information loss are controlled and measured simultaneously.

A further disclosure control procedure includes the treatment of the design variables on the full restricted-use analytic data file, namely VEREP (variance estimation [pseudo] replicate within stratum) and VESTRQ1Q4 (variance estimation [pseudo] stratum). These replicate and stratum identifiers were treated by coarsening, substitution, and scrambling to produce the versions of the design variables included on the PUF. Similar to the 2014 to 2019 PUFs, the 2020 PUF's variance estimation stratum variable VESTRQ1Q4\_C was aggregated into 50 pseudo-strata due to the sample redesign since the 2014 NSDUH, whereas in 2013 and prior years, there were 60 pseudo-strata. In addition, certain variables were recoded (e.g., by collapsing of rare levels), collapsed (e.g., by combining low frequency variables) to make composite variables, or locally suppressed (e.g., by setting to missing values) for confidentiality reasons.

These statistical disclosure limitation methods have been implemented in such a way that the PUF continues to be representative of civilian members of the noninstitutionalized population in the United States. The 2020 PUF contains 32,893 records.

## **16. Public Use File Weight Calibration**

As noted in Section 15, Confidentiality of Data, after the substitution step in MASSC, some respondents have their identifying variables changed, and after the subsampling step, a dataset that is a subset of the original full sample of the analytic data file is produced. Thus, weight calibration is needed in which the PUF weights are calibrated to the full sample totals to reduce bias due to substitution and variance due to subsampling.

In the subsampling step, the SAS procedure SURVEYSELECT was used to select a subsample based on the selection probabilities obtained from the subsampling step for each

record. The Chromy sampling method<sup>48</sup> was used to sequentially draw a random subsample within each stratum defined by the sampling design variables VEREP and VESTRQ1Q4 (i.e., the analytic full sample design variables before disclosure treatment). For each record, SAS generated a weight adjustment, which is approximately the inverse probability of selection for that record. The original analysis weight ANALWT\_Q1Q4 was multiplied by this weight adjustment to get an intermediate subsample weight ANALWTQ1Q4\_2. This step accounts for the different subsampling rates for the respondents and ensures that the total weight of the subsample (ANALWTQ1Q4\_2) is close to the total weight of the original sample (ANALWT\_Q1Q4).

In the calibration step, ANALWTQ1Q4\_2 was further adjusted so that the sum of the final PUF weights (ANALWTQ1Q4\_C) matched the sum of ANALWT\_Q1Q4 from the original analytic data for a set of main study variables and auxiliary variables (which were select identifying variables, such as demographic variables). This process, known as calibration in MASSC, is a poststratification adjustment and helps reduce bias due to substitution and variance due to subsampling. The generalized exponential model (GEM) developed by Folsom and Singh<sup>49</sup> was used for this poststratification, and the control total used for poststratification was the final analysis weight ANALWT\_Q1Q4 from the full analytic dataset. Variables (both main effects and two-way interactions) used in the weight calibration in GEM were typically demographic variables. Sometimes, a few of the variables were dropped or collapsed if they had a zero or a small sample size or if the model had convergence issues. The sampling weights on the PUF were adjusted for subsampling and calibrated with respect to approximately 45 demographic domains. A sublist of the domains that match their respective U.S. Census Bureau population estimates can be found in [Table 1](#) (shown earlier), where an alternative way can be used to estimate SEs of the totals; for details, see Section 13, Variance Estimation of Estimated Numbers of Individuals.

For each record on the PUF, the final weight after calibration was referred to as ANALWTQ1Q4\_C, which is the product of ANALWTQ1Q4\_2 and the weighting adjustment factor from GEM. The sum of ANALWTQ1Q4\_C on the PUF is identical to the sum of ANALWT\_Q1Q4 on the full analytic file, both overall and by values of the calibration variables in [Table 1](#).

## 17. Public Use File Estimates and Standard Errors

A number of variables were reviewed after the above disclosure avoidance process was completed to determine the impact of these techniques on the bias and precision of estimates compared with those from the full (i.e., untreated or restricted-use) file. These variables included both variables for which partial records were substituted and other variables that were not perturbed. In addition, the change in precision in estimates was studied for 340 combinations of

<sup>48</sup> Chromy, J. R. (1979). Sequential sample selection methods. In *Proceedings of the 1979 American Statistical Association, Survey Research Methods Section, Washington, DC* (pp. 401-406). Retrieved from <http://www.asasrms.org/Proceedings/index.html>

<sup>49</sup> Folsom, R. E., & Singh, A. C. (2000). The generalized exponential model for sampling weight calibration for extreme values, nonresponse, and poststratification. In *Proceedings of the 2000 Joint Statistical Meetings, American Statistical Association, Survey Research Methods Section, Indianapolis, IN* (pp. 598-603). Retrieved from <http://www.asasrms.org/Proceedings/index.html>

34 domains and 10 response variables (e.g., the combination of past month alcohol use in the 12 to 17 age group). The ratio of the estimates from the PUF and the full restricted-use file was calculated for each domain and response variable combination. The average ratio over the 34 domains for the 10 response variables was within the 0.93 to 1.00 range. Similarly, to assess the decrease in precision, the SE was compared between the PUF and the full restricted-use file. For the 10 response variables, the average increase in SEs over the 34 domains was about 0.6 to 8 percent, with the exception of CIGMON (past month cigarette use) and INHALFLAG (inhalants ever used indicator), which had an average increase in the SE of about 12 percent, and COCYR (cocaine past year use), which had an average decrease in the SE of about 4 percent.

Survey analysis software can be used (along with the weight variable ANALWTQ1Q4\_C and the PUF design variables VEREP and VESTRQ1Q4\_C) to produce estimates and their SEs. [Tables 2](#) and [3](#) show the ratios of the prevalence estimates and their SEs calculated from the PUF to those calculated from the full restricted-use file for certain demographic domains not included in the calibration constraints.

[Table 2](#) shows the ratios of prevalence estimates and SEs from the PUF subsample to the full sample for past month marijuana use, a relatively high prevalence drug. [Table 3](#) shows the same ratios for past year heroin use, a relatively low prevalence drug. The results are shown for seven demographic domains.

**Table 2. Past Month Marijuana Prevalence and Standard Error Ratios of the Public Use File Subsample to the Full Sample, by Seven Domains: 2020**

Domain	Prevalence Ratio	Standard Error Ratio
Non-Hispanic American Indian or Alaska Native	1.04	0.89
Non-Hispanic Native Hawaiian or Other Pacific Islander	1.13	1.14
Non-Hispanic Asian	1.06	0.71
Non-Hispanic Two or More Races	1.05	1.07
Household with Four Members	0.99	1.02
Household with Five Members	0.98	1.15
Household with Six or More Members	0.96	1.10

Note: Ratio = (Public use file subsample estimate/Full analytic sample estimate).

Source: SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health, 2020.

**Table 3. Past Year Heroin Prevalence and Standard Error Ratios of the Public Use File Subsample to the Full Sample, by Seven Domains: 2020**

Domain	Prevalence Ratio	Standard Error Ratio
Non-Hispanic American Indian or Alaska Native	1.42	1.42
Non-Hispanic Native Hawaiian or Other Pacific Islander	..	..
Non-Hispanic Asian	..	..
Non-Hispanic Two or More Races	1.25	1.21
Household with Four Members	1.09	1.06
Household with Five Members	0.70	0.78
Household with Six or More Members	0.74	0.97

Note: Ratio = (Public use file subsample estimate/Full analytic sample estimate). Missing cells (signified by two dots) are due to a zero-observed prevalence rate in certain race/ethnicity domains.

Source: SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health, 2020.

Users of the NSDUH PUFs are cautioned against analyzing and interpreting near zero or low prevalence outcomes and estimates based on small sample sizes (like estimates in [Table 3](#)). PUF users are encouraged to implement suppression criteria<sup>[50](#)</sup> in order to suppress estimates considered to have low precision.

Information on how to define options for analyzing NSDUH PUF data along with sample SUDAAN, SAS, and Stata code for producing estimates, performing statistical tests of differences, and fitting linear or logistic regression models are provided in an appendix titled Sample SUDAAN, SAS, and Stata Code and PUF Estimates. Additionally, a few sample tables produced from the 2020 NSDUH PUF are included in that appendix so that users can ensure that PUF data are downloaded correctly by replicating the estimates in those tables.

## 18. Special Types of Analyses

Data file users who wish to analyze data from multiple survey years, including 2020 (e.g., 2002 through 2020<sup>[51](#)</sup>), should first sort the combined data by the sample design variables (VESTRQ1Q4\_C in 2020 and VESTR in prior years and VEREP). These variables then are specified in a software package, such as SUDAAN, to automatically account for the 50 percent overlap between successive years when estimating variances and SEs. The final PUF person-level analysis weight on the data file should be used when analyzing data for any single year or when comparing estimates between years within a combined file containing data from multiple years. The 2020 person-level analysis weight variable names and variance estimation variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. Estimation of the annual average number of individuals who have engaged in a particular behavior based upon pooled data from multiple years requires adjustment to the analysis weights. These adjusted weights would be created as the final weight divided by the number of years of combined data (e.g., the person-level weight divided by 19 for estimates based on the 19-year combined data from 2002 through 2020).

Any inference drawn from estimates or analyses based on pooling 2020 data with previous years needs to be viewed in conjunction with the 2020 data changes mentioned previously. For example, estimates based on pooling multiple years of data involving 2020 data will represent an overall average of temporal, mode of data collection, and COVID-19 pandemic effects. As more and more data are pooled, any effects of mode of data collection in 2020 and the COVID-19 pandemic on the resulting estimates or analyses will diminish. Data users should exercise caution when comparing estimates from 2020 with estimates from prior years. Given the methodological changes that occurred in 2020, independent reasons for differences in estimates from 2020 and prior years cannot be determined conclusively. Also, as mentioned in Section 15, Confidentiality of Data, the variable QUARTER is not available on the 2020 PUF; therefore, generating estimates using some combination of quarter-level data is not permitted.

---

<sup>[50](#)</sup> The suppression rules used for the 2020 NSDUH national estimates are in Section 3.2.2 of the 2020 NSDUH methodological summary and definitions. However, PUF users can use their own discretion to formulate appropriate suppression rules.

<sup>[51](#)</sup> Changes in the sample design are accounted for in the sample design variables. Therefore, it is appropriate to combine 2002 through 2013 data with data from 2014 and onward.

In years when a split-sample design is implemented (such as in 2004), a special weight is developed for the split samples. When analysis with pooled data from multiple years is conducted, analysts should check the documents for those specific years on how to use the analysis weights in order to use a proper weight for the pooled data analysis.

For details on how to analyze several years of combined PUF data, refer to the section on Examples of SUDAAN, Stata, and SAS Code in the combined 2002-2019 PUF codebook addendum.<sup>52</sup>

---

<sup>52</sup> From the main SAMHDA webpage at <https://datafiles.samhsa.gov/>, click on the “Data Sources” tab. Next, select “Population Data (NSDUH)” from the drop-down list. Click on “Choose Year” and select “NSDUH 2002-2019” then click on “Related Files.” The 2002-2019 addendum is available as a Word file download with a filename of “nsduh-2002-2019-ds0001-other-combined-puf-addendum-02-19.docx”.

## IDENTIFICATION

### **IDENTIFICATION**

The following variable, QUESTID2, is a unique record identifier within a particular study year. The IDs may be repeated in other study years, so analysts should always consider the study year when using the QUESTID2.

[QUESTID2](#)      Len : 7    RESPONDENT IDENTIFICATION

The following variable, FILEDATE, represents the date the SAS data file was created.

[FILEDATE](#)      Len : 10    CREATION DATE OF THE DATA FILE

NOTE: Beginning in 2015, level 975 was updated to "AT LEAST 4 or 5 Logically assigned" to reflect the change in the threshold for binge alcohol use among female respondents from 5 or more drinks on an occasion prior to 2015 to 4 or more drinks on an occasion in 2015. See the note below for ALCBNG30D.

On the ALC30DAY/ALCESTFL days that you drank during the past 30 days, how many drinks did you usually have? Count as a drink a can or bottle of beer; a wine cooler or a glass of wine, champagne, or sherry; a shot of liquor or a mixed drink or cocktail.

<i>(AL07)</i>	Len : 3 USUAL # OF DRINKS PER DAY PAST 30 DAYS	<b>Freq</b>	<b>Pct</b>

## ALCOHOL

NOTE: Beginning in 2015, female respondents were asked ALCBNG30D to report the number of days that they had 4 or more drinks on the same occasion in the past 30 days. As in prior years, male respondents in 2015 were asked for ALCBNG30D to report the number of days that they had 5 or more drinks on the same occasion in the past 30 days.

During the past 30 days, that is since [DATEFILL], on how many days did you have [4 or more]/[5 or more] drinks on the same occasion? By "occasion," we mean at the same time or within a couple of hours of each other.

## MARIJUANA

### MARIJUANA

The next questions are about marijuana and hashish. Marijuana is also called pot or grass. Marijuana is usually smoked, either in cigarettes, called joints, or in a pipe. It is sometimes cooked in food. Hashish is a form of marijuana that is also called "hash." It is usually smoked in a pipe. Another form of hashish is hash oil.

Have you ever, even once, used marijuana or hashish?

## HALLUCINOGENS

### HALLUCINOGENS

The next questions are about substances called hallucinogens. These drugs often cause people to see or experience things that are not real.

A list of some common hallucinogens is shown below. These and many other substances that people use as hallucinogens are often known by street names, and we can't list them all. Please take a moment to look at the substances listed below so you know what kind of drugs the next questions are about.

LSD, also called 'acid'  
 PCP, also called 'angel dust' or phencyclidine  
 Peyote  
 Mescaline  
 Psilocybin  
 'Ecstasy' or 'Molly', also called MDMA  
 Ketamine, also called 'Special K' or 'Super K'  
 DMT, also called dimethyltryptamine  
 AMT, also called alpha-methyltryptamine  
 Foxy, also called 5-MeO-DIPT  
 Salvia divinorum

Have you ever, even once, used LSD, also called 'acid'?

(LS01A, LSREF1)

LSD Len : 2 EVER USED LSD ("ACID")

	<b>Freq</b>	<b>Pct</b>
1 = Yes.....	3086	9.38
2 = No.....	2117	6.44

## INHALANTS

### INHALANTS

These next questions are about liquids, sprays, and gases that people sniff or inhale to get high or to make them feel good.

We are not interested in times when you inhaled a substance accidentally — such as when painting, cleaning an oven, or filling a car with gasoline. The questions use the word 'inhalant' to include all the things listed below, as well as any other substances that people sniff or inhale for kicks or to get high. Take a moment to look at the substances listed below so you know what kinds of liquids, sprays, and gases these questions are about.

Amyl nitrite, 'poppers,' locker room odorizers, or 'rush'  
 Correction fluid, degreaser, or cleaning fluid  
 Gasoline or lighter fluid  
 Glue, shoe polish, or toluene  
 Halothane, ether, or other anesthetics  
 Lacquer thinner, or other paint solvents  
 Lighter gases, such as butane or propane  
 Nitrous oxide or 'whippets'  
 Felt-tip pens, felt-tip markers, or magic markers  
 Spray paints  
 Computer keyboard cleaner, also known as air duster  
 Other aerosol sprays

Have you ever, even once, inhaled amyl nitrite, 'poppers,' locker room odorizers, or 'rush' for kicks or to get high?

*(IN01A)*

The answers that people give us about their use of inhalants are important to this study's success. We know that this information is personal, but remember your answers will be kept confidential.

Please think again about answering this question: Have you ever, even once, used any type of inhalant for kicks or to get high?

NOTE: This variable was coded as 1 if respondents answered yes to the above question and 91 if respondents answered the above question as no (see below). This variable also was coded as 1 if the questions corresponding to any of the following variables were answered as yes: AMYLNIT, CLEFLU, GAS, GLUE, ETHER, SOLVENT, LGAS, NITOXID, FELTMARKR, SPPAINT, AIRDUSTER, OTHAEROS, or INHALOTH. This variable also was coded as 91 if all of the above variables were coded as 91.

*(AIRDUSTER, AMYLNIT, CLEFLU, ETHER, FELTMARKR, GAS, GLUE, INHALOTH, INREF, LGAS, NITOXID, OTHAEROS, SOLVENT, SPPAINT)*

## PAIN RELIEVERS

### PAIN RELIEVERS

The next question asks about using prescription pain relievers in any way a doctor did not direct you to use them.

When you answer these questions, please think only about your use of the drug in any way a doctor did not direct you to use it, including:

- Using it without a prescription of your own
- Using it in greater amounts, more often, or longer than you were told to take it
- Using it in any other way a doctor did not direct you to use it

Have you ever, even once, used any prescription pain reliever in any way a doctor did not direct you to use it?

## TRANQUILIZERS

### TRANQUILIZERS

The next question asks about using prescription tranquilizers in any way a doctor did not direct you to use them.

When you answer these questions, please think only about your use of the drug in any way a doctor did not direct you to use it, including:

- Using it without a prescription of your own
- Using it in greater amounts, more often, or longer than you were told to take it
- Using it in any other way a doctor did not direct you to use it

Have you ever, even once, used any prescription tranquilizer in any way a doctor did not direct you to use it?

(TRL01, TRL02)

TRQNMIF Len : 2 EVER USED TRANQUILIZER NOT DIRECTED BY DR

	<b>Freq</b>	<b>Pct</b>
1 = Yes.....	720	2.19
2 = No.....	4894	14.88
5 = Yes LOGICALLY ASSIGNED (from skip pattern).....	674	2.05
85 = BAD DATA Logically assigned .....	7	0.02
91 = NEVER USED/MISUSED TRANQUILIZERS .....	26322	80.02
94 = DON'T KNOW .....	5	0.02
97 = REFUSED .....	3	0.01
98 = BLANK (NO ANSWER) .....	268	0.81

NOTE: The variable TRQNMREC is a recoded variable that was created from TRQNMIF, the 12-month misuse variables of specific tranquilizers, and TRANQNM30DY.

TRQNMREC

Len : 2 RC - MOST RECENT TRANQUILIZER MISUSE (RECODE)

	<b>Freq</b>	<b>Pct</b>
1 = Within the past 30 days.....	185	0.56
2 = More than 30 days ago but within the past 12 mos .....	488	1.48
3 = More than 12 months ago .....	713	2.17
8 = Misused at some point in past 12 mos LOG ASSN.....	1	0.00
9 = Misused at some point in lifetime LOG ASSN .....	7	0.02

91 = NEVER USED/MISUSED TRANQUILIZERS .....	31216	94.90
98 = BLANK (NO ANSWER) .....	166	0.50

NOTE: TRQNMINIT is "reverse coded" from the answers in TRL03. TRL03=1 (yes) was recoded to 2 in TRQNMINIT because this answer means that the respondent misused tranquilizers before the past 12 months (and therefore is not a past year initiate for misuse of tranquilizers). TRL03=2 (no) was recoded to 1 in TRQNMINIT because this answer means that the respondent did not misuse tranquilizers before the past 12 months (and therefore is a past year initiate for misuse of tranquilizers).

Earlier questions were about the past 12 months. This question is about any time before then, that is, any time in your life before [DATEFILL].

At any time before [DATEFILL], did you ever use any prescription tranquilizer in a way a doctor did not direct you to use it?

(TRL03)

## TRANQUILIZERS

NOTE: Responses of "yes" in TRQNM30AL were assigned a code of 11 when respondents reported that they misused tranquilizers with alcohol in the past 30 days but there was some question from the edited alcohol data about whether they used alcohol in the past 30 days. Analysts are encouraged to check the value of the final imputed alcohol recency IRALCRC when TRQNM30AL=11 to determine whether IRALCRC was assigned a value to indicate that the most recent use of alcohol was within the past 30 days or was more than 30 days ago but within the past 12 months.

During the past 30 days, did you use [TRNAMEFILL] in any way a doctor did not direct you to use [TRNUMFILL] while you were drinking alcohol or within a couple of hours of drinking?

## STIMULANTS

### **STIMULANTS**

The next question asks about using prescription stimulants in any way a doctor did not direct you to use them.

When you answer these questions, please think only about your use of the drug in any way a doctor did not direct you to use it, including:

- Using it without a prescription of your own
- Using it in greater amounts, more often, or longer than you were told to take it
- Using it in any other way a doctor did not direct you to use it

Have you ever, even once, used any prescription stimulant in any way a doctor did not direct you to use it?

(*STL01, STL02*)

**STMNMLIF**

Len : 2 EVER USED STIMULANT NOT DIRECTED BY DR

	<b>Freq</b>	<b>Pct</b>
1 = Yes.....	924	2.81
2 = No.....	2785	8.47
5 = Yes LOGICALLY ASSIGNED (from skip pattern) .....	767	2.33
85 = BAD DATA Logically assigned .....	3	0.01
91 = NEVER USED/MISUSED STIMULANTS .....	28185	85.69
94 = DON'T KNOW .....	10	0.03
97 = REFUSED .....	1	0.00
98 = BLANK (NO ANSWER) .....	218	0.66

NOTE: The variable STMNMREC is a recoded variable that was created from STMNMLIF, the 12-month misuse variables of specific stimulants, and STIMNM30DY.

**STMNMREC**

Len : 2 RC - MOST RECENT STIMULANT MISUSE (RECODE)

	<b>Freq</b>	<b>Pct</b>
1 = Within the past 30 days.....	221	0.67
2 = More than 30 days ago but within the past 12 mos .....	544	1.65
3 = More than 12 months ago .....	922	2.80
8 = Misused at some point in past 12 mos LOG ASSN.....	2	0.01
9 = Misused at some point in lifetime LOG ASSN .....	2	0.01

91 = NEVER USED/MISUSED STIMULANTS .....	30970	94.15
98 = BLANK (NO ANSWER) .....	167	0.51

NOTE: STMMINIT is "reverse coded" from the answers in STL03. STL03=1 (yes) was recoded to 2 in STMMINIT because this answer means that the respondent misused stimulants before the past 12 months (and therefore is not a past year initiate for misuse of stimulants). STL03=2 (no) was recoded to 1 in STMMINIT because this answer means that the respondent did not misuse stimulants before the past 12 months (and therefore is a past year initiate for misuse of stimulants).

Earlier questions were about the past 12 months. This question is about any time before then, that is, any time in your life before [DATEFILL].

At any time before [DATEFILL], did you ever use any prescription stimulant in a way a doctor did not direct you to use it?

(*STL03*)

98 = BLANK (NO ANSWER) .....		32882	99.97

## SEDATIVES

### **SEDATIVES**

The next question asks about using prescription sedatives in any way a doctor did not direct you to use them.

When you answer these questions, please think only about your use of the drug in any way a doctor did not direct you to use it, including:

- Using it without a prescription of your own
- Using it in greater amounts, more often, or longer than you were told to take it
- Using it in any other way a doctor did not direct you to use it

Have you ever, even once, used any prescription sedative in any way a doctor did not direct you to use it?

(*SVL01, SVL02*)  
**SEDNMLIF**

Len : 2 EVER USED SEDATIVE NOT DIRECTED BY DR

	<b>Freq</b>	<b>Pct</b>
1 = Yes.....	537	1.63
2 = No.....	2670	8.12
5 = Yes LOGICALLY ASSIGNED (from skip pattern) .....	151	0.46
85 = BAD DATA Logically assigned .....	4	0.01
91 = NEVER USED/MISUSED SEDATIVES .....	29232	88.87
94 = DON'T KNOW .....	6	0.02
98 = BLANK (NO ANSWER) .....	293	0.89

NOTE: The variable SEDNMREC is a recoded variable that was created from SEDNMLIF, the 12-month misuse variables of specific sedatives, and SEDTVNM30DY.

**SEDNMREC**

Len : 2 RC - MOST RECENT SEDATIVE MISUSE (RECODE)

	<b>Freq</b>	<b>Pct</b>
1 = Within the past 30 days.....	47	0.14
2 = More than 30 days ago but within the past 12 mos .....	102	0.31
3 = More than 12 months ago .....	537	1.63
8 = Misused at some point in past 12 mos LOG ASSN.....	2	0.01
83 = DID NOT MISUSE PST 12 MOS (LIFETIME UNK) Log assn .....	103	0.31
91 = NEVER USED/MISUSED SEDATIVES .....	31902	96.99
98 = BLANK (NO ANSWER) .....	200	0.61

NOTE: SEDNMINIT is "reverse coded" from the answers in SVL03. SVL03=1 (yes) was recoded to 2 in SEDNMINIT because this answer means that the respondent misused sedatives before the past 12 months (and therefore is not a past year initiate for misuse of sedatives). SVL03=2 (no) was recoded to 1 in SEDNMINIT because this answer means that the respondent did not misuse sedatives before the past 12 months (and therefore is a past year initiate for misuse of sedatives).

Earlier questions were about the past 12 months. This question is about any time before then, that is, any time in your life before [DATEFILL].

At any time before [DATEFILL], did you ever use any prescription sedative in a way a doctor did not direct you to use it?

(*SVL03*)

## RECENTY OF DRUG USE

NOTE: The following 10 variables refer to any use of prescription drugs. Any Use of prescription drugs is defined as either the use of one's own prescription medication as directed by a doctor or the misuse of prescription drugs. Misuse of prescription drugs is defined as use in any way not directed by a doctor, including use without a prescription of one's own medication; use in greater amounts, more often, or longer than told to take a drug; or use in any other way not directed by a doctor. Due to potential underreporting of lifetime prescription drug use, users are cautioned against using the levels 'More than 12 months ago' and 'NEVER USED XXX' in analysis for the following variables: IRPNRANYREC, IRTRQANYREC, IRSTMANYREC, and IRSEDANYREC.

NOTE: The following 10 variables refer to the misuse of prescription drugs. Misuse of prescription drugs is defined as use in any way not directed by a doctor, including use without a prescription of one's own medication; use in greater amounts, more often, or longer than told to take a drug; or use in any other way not directed by a doctor. Due to potential underreporting of lifetime prescription drug use, users are cautioned against using the levels 'More than 12 months ago' and 'NEVER MISUSED XXX' in analysis for the following variables: IRPNRMREC, IRTRQNMREC, IRSTMNMREC, and IRSEDNMREC.

"Binge" Alcohol Frequency, IRALCBNG30D, is defined as the number of days in the past month on which the respondent reported drinking five or more drinks on the same occasion for males or four or more drinks on the same occasion for females. For this variable, "occasion" means at the same time or within a couple hours of each other. Prior to 2015, "binge" alcohol frequency was defined as the number of days in the past month on which the respondent reported drinking five or more drinks on the same occasion for everyone, regardless of sex. Therefore, IRALCBNG30D is comparable to the version of this variable created from 2002-2014, IRALCD5, among males but not overall or among females.

#### RECODED DRUG USE

NOTE: The following 13 variables refer to any use of prescription drugs. Any Use of prescription drugs is defined as either the use of one's own prescription medication as directed by a doctor or the misuse of prescription drugs. Misuse of prescription drugs is defined as use in any way not directed by a doctor, including use without a prescription of one's own medication; use in greater amounts, more often, or longer than told to take a drug; or use in any other way not directed by a doctor.

Due to potential underreporting of lifetime prescription drug use, users are cautioned against using the lifetime use or misuse of prescription pain relievers (ever used/ever misused) in analysis.

<i>(IRPNRANYREC)</i>	<u>PNRANYFLAG</u>	Len : 1 RC-ANY PAIN RELIEVER - EVER USED	<b>Freq</b>	<b>Pct</b>
		0 = Never used (IRPNRANYREC = 9).....	15854	48.20
		1 = Ever used (IRPNRANYREC = 1-2) .....	17039	51.80

## RECODED DRUG USE

Due to potential underreporting of lifetime prescription drug use, users are cautioned against using the lifetime use of illicit drugs other than marijuana variable in analysis. This caution does not apply to lifetime use of any illicit drug variable given it is dominated by lifetime marijuana use.

"Binge" Alcohol Use, BNGDRKMON, is defined as drinking five or more drinks on the same occasion for males or four or more drinks on the same occasion for females on at least one day in the past 30 days. For this variable, "occasion" means at the same time or within a couple hours of each other. Prior to 2015, "binge" alcohol use was defined as drinking five or more drinks on the same occasion for everyone, regardless of sex. Therefore, BNGDRKMON is comparable to the version of this variable created from 2002-2014, BINGEDRK, among males but not overall or among females.

The following main reason for misusing pain relievers, PNRRMAINRSN, is defined based on answers to questions about respondents' reasons for misusing pain relievers for their last misuse. Respondents could report more than one reason for misusing pain relievers the last time. If they reported more than one reason, then they were asked to report the main reason. If data existed for the main reason question, then that response was considered to be their main reason. If respondents reported only one reason for their last misuse, then that logically was the main reason (i.e., these respondents were not asked the question for their main reason). If respondents reported that some other reason was their main reason for their last misuse, then their response was logically assigned from the write in data. In the documentation below, values of 11-18 in PNRRSMAIN reflect situations where respondents reported more than one reason for their last misuse, their "other" reason for their last misuse was their main reason for their last misuse, but the other reason was the reason specified as one of the eight categories below.

1. Main reason is to relieve physical pain (PNRRSMAIN=1,11), reported only one reason which was to relieve physical pain (PNRRSMAIN=99 and PNRRSPAIN=1), or reported some other reason as their only reason but specified that this other reason was to relieve physical pain (PNRRSMAIN=99 and PNRRSPAIN=3).
2. Main reason is to relax or relieve tension (PNRRSMAIN=2,12), reported only one reason which was to relax or relieve tension (PNRRSMAIN=99 and PNRRSRELX=1), or reported some other reason as their only reason but specified that this other reason was to relax or relieve tension (PNRRSMAIN=99 and PNRRSRELX=3).
3. Main reason is to experiment or see what it's like (PNRRSMAIN=3,13), reported only one reason which was to experiment or see what it's like (PNRRSMAIN=99 and PNRRSEXPT=1), or reported some other reason as their only reason but specified that this other reason was to experiment or see what it's like (PNRRSMAIN=99 and PNRRSEXPT=3).
4. Main reason is to feel good or get high (PNRRSMAIN=4,14), reported only one reason which was to feel good or get high (PNRRSMAIN=99 and PNRRSHIGH=1), or reported some other reason as their only reason but specified that this other reason was to feel good or get high (PNRRSMAIN=99 and PNRRSHIGH=3).
5. Main reason is to help with sleep (PNRRSMAIN=5,15), reported only one reason which was to help with sleep (PNRRSMAIN=99 and PNRRSSLEP=1), or reported some other reason as their only reason but specified that this other reason was to help with sleep (PNRRSMAIN=99 and PNRRSSLEP=3).
6. Main reason is to help with feelings or emotions (PNRRSMAIN=6,16), reported only one reason which was to help with feelings or emotions (PNRRSMAIN=99 and PNRRSEMOT=1), or reported some other reason as their only reason but specified that this other reason was to help with feelings or emotions (PNRRSMAIN=99 and PNRRSEMOT=3).
7. Main reason is to increase/decrease effects of other drugs (PNRRSMAIN=7,17), reported only one reason which was to increase/decrease the effects of other drugs (PNRRSMAIN=99 and PNRRSDGFX=1), or reported some other reason as their only reason but specified that this other reason was to increase/decrease the effects of other drugs (PNRRSMAIN=99 and PNRRSDGFX=3).
8. Main reason is because hooked or have to have drug (PNRRSMAIN=8,18), reported only one reason which was because they were hooked or had to have the drug (PNRRSMAIN=99 and PNRRSHOOK=1), or reported some other reason as their only reason but specified that this other reason was because they were hooked or had to have the drug (PNRRSMAIN=99 and PNRRSHOOK=3).
9. Main reason is some other reason (PNRRSMAIN=9), or reported only one reason which was a valid other reason listed for pain relievers other than those defined above based on the write in data (PNRRSMAIN=99 and PNRRSSOR=1 and PNRRSOTRS2=9-71). Values of 1-8 that are in the specific other reason level are write in responses that do not correspond to reasons listed for pain relievers but are considered valid reasons so are not excluded.

(System Missing): Main reason is unknown (PNRRSMAIN=85,94,98) or reported only one reason and the other pain reliever reason was not a valid reason (PNRRSMAIN=99 and PNRRSSOR=1 and PNRRSOTRS2=985,994,997).

#### RECODED DRUG USE

The following main reason for misusing stimulants, STMMAINRSN, is defined based on answers to questions about respondents' reasons for misusing stimulants for their last misuse. Respondents could report more than one reason for misusing stimulants the last time. If they reported more than one reason, then they were asked to report the main reason. If data existed for the main reason question, then that response was considered to be their main reason. If respondents reported only one reason for their last misuse, then that logically was the main reason (i.e., these respondents were not asked the question for their main reason). If respondents reported that some other reason was their main reason for their last misuse, then their response was logically assigned from the write in data. In the documentation below, values of 11-18 in STMRSMAIN reflect situations where respondents reported more than one reason for their last misuse, their "other" reason for their last misuse was their main reason for their last misuse, but the other reason was the reason specified as one of the eight categories below.

1. Main reason is to help lose weight (STMRSMAIN=1,11), reported only one reason which was to help lose weight (STMRSMAIN=99 and STMRSWGHT=1), or reported some other reason as their only reason but specified that this other reason was to help lose weight (STMRSMAIN=99 and STMRSWGHT=3).
2. Main reason is to help concentrate (STMRSMAIN=2,12), reported only one reason which was to help concentrate (STMRSMAIN=99 and STMRSCONC=1), or reported some other reason as their only reason but specified that this other reason was to help concentrate (STMRSMAIN=99 and STMRSCONC=3).
3. Main reason is to help be alert or stay awake (STMRSMAIN=3,13), reported only one reason which was to help be alert or stay awake (STMRSMAIN=99 and STMRSALRT=1), or reported some other reason as their only reason but specified that this other reason was to help be alert or stay awake (STMRSMAIN=99 and STMRSALRT=3).
4. Main reason is to help study (STMRSMAIN=4,14), reported only one reason which was to help study (STMRSMAIN=99 and STMRSSTDY=1), or reported some other reason as their only reason but specified that this other reason was to help study (STMRSMAIN=99 and STMRSSTDY=3).
5. Main reason is to experiment or see what it's like (STMRSMAIN=5,15), reported only one reason which was to experiment or see what it's like (STMRSMAIN=99 and STMSEXPT=1), or reported some other reason as their only reason but specified that this other reason was to experiment or see what it's like (STMRSMAIN=99 and STMSEXPT=3).
6. Main reason is to feel good or get high (STMRSMAIN=6,16), reported only one reason which was to feel good or get high (STMRSMAIN=99 and STMRESHIGH=1), or reported some other reason as their only reason but specified that this other reason was to feel good or get high (STMRSMAIN=99 and STMRESHIGH=3).
7. Main reason is to increase/decrease effects of other drugs (STMRSMAIN=7,17), reported only one reason which was to increase/decrease the effects of other drugs (STMRSMAIN=99 and STMRSDEGFX=1), or reported some other reason as their only reason but specified that this other reason was to increase/decrease the effects of other drugs (STMRSMAIN=99 and STMRSDEGFX=3).
8. Main reason is because hooked or have to have the drug (STMRSMAIN=8,18), reported only one reason which was because they were hooked or had to have the drug (STMRSMAIN=99 and STMRSHOOK=1), or reported some other reason as their only reason but specified that this other reason was because they were hooked or had to have the drug (STMRSMAIN=99 and STMRSHOOK=3).
9. Main reason is some other reason (STMRSMAIN=9), or reported only one reason which was a valid other reason listed for stimulant other than those defined above based on the write in data (STMRSMAIN=99 and STMRSSOR=1 and STMRSOTRS2=1,2,6,14-35). Values of 3,4, and 7-12 that are in the specific other reason level are write in responses that do not correspond to reasons listed for stimulants but are considered valid reasons so are not excluded.

(System Missing): Main reason is unknown (STMRSMAIN=85,94,98) or reported only one reason and the other reason was not a valid reason (STMRSMAIN=99 and STMRSSOR=1 and STMRSOTRS2 = 985,994,997).

#### RECODED DRUG USE

The following main reason for misusing sedatives, SEDMAINRSN, is defined based on answers to questions about respondents' reasons for misusing sedatives for their last misuse. Respondents could report more than one reason for misusing sedatives the last time. If they reported more than one reason, then they were asked to report the main reason. If data existed for the main reason question, then that response was considered to be their main reason. If respondents reported only one reason for their last misuse, then that logically was the main reason (i.e., these respondents were not asked the question for their main reason). If respondents reported that some other reason was their main reason for their last misuse, then their response was logically assigned from the write in data. In the documentation below, values of 11-17 in SEDRSMAIN reflect situations where respondents reported more than one reason for their last misuse, their "other" reason for their last misuse was their main reason for their last misuse, but the other reason was the reason specified as one of the seven categories below.

1. Main reason is to relax or relieve tension (SEDRSMAIN=1,11), reported only one reason which was to relax or relieve tension (SEDRSMAIN=99 and SEDRSRELX=1), or reported some other reason as their only reason but specified that this other reason was to relax or relieve tension (SEDRSMAIN=99 and SEDRSRELX=3).
2. Main reason is to experiment or see what it's like (SEDRSMAIN=2,12), reported only one reason which was to experiment or see what it's like (SEDRSMAIN=99 and SEDRSEXPT=1), or reported some other reason as their only reason but specified that this other reason was to experiment or see what it's like (SEDRSMAIN=99 and SEDRSEXPT=3).
3. Main reason is to feel good or get high (SEDRSMAIN=3,13), reported only one reason which was to feel good or get high (SEDRSMAIN=99 and SEDRSHIGH=1), or reported some other reason as their only reason but specified that this other reason was to feel good or get high (SEDRSMAIN=99 and SEDRSHIGH=3).
4. Main reason is to help with sleep (SEDRSMAIN=4,14), reported only one reason which was to help with sleep (SEDRSMAIN=99 and SEDRSSLEP=1), or reported some other reason as their only reason but specified that this other reason was to help with sleep (SEDRSMAIN=99 and SEDRSSLEP=3).
5. Main reason is to help with feelings or emotions (SEDRSMAIN=5,15), reported only one reason which was to help with feelings or emotions (SEDRSMAIN=99 and SEDRSEMOT=1), or reported some other reason as their only reason but specified that this other reason was to help with feelings or emotions (SEDRSMAIN=99 and SEDRSEMOT=3).
6. Main reason is to increase/decrease effects of other drugs (SEDRSMAIN=6,16), reported only one reason which was to increase/decrease the effects of other drugs (SEDRSMAIN=99 and SEDRSDGFX=1), or reported some other reason as their only reason but specified that this other reason was to increase/decrease the effects of other drugs (SEDRSMAIN=99 and SEDRSDGFX=3).
7. Main reason is because hooked or have to have the drug (SEDRSMAIN=7,17), reported only one reason which was because they were hooked or had to have the drug (SEDRSMAIN=99 and SEDRSHOOK=1), or reported some other reason as their only reason but specified that this other reason was because they were hooked or had to have the drug (SEDRSMAIN=99 and SEDRSHOOK=3).
8. Main reason is some other reason (SEDRSMAIN=8), or reported only one reason which was a valid other reason listed for sedative other than those defined above based on the write in data (SEDRSMAIN=99 and SEDRSSOR=1 and SEDRSOTRS2=1, 9-33). Values of 2-8 that are in the specific other reason level are write in responses that do not correspond to reasons listed for sedatives but are considered valid reasons so are not excluded.

(System Missing): Main reason is unknown (SEDRSMAIN=85,94,98) or reported only one reason and the other reason was not a valid reason (SEDRSMAIN=99 and SEDRSSOR=1 and SEDRSOTRS2=985,994,997).

## RECODED DRUG USE

NOTE: Due to the 2015 questionnaire redesign, measures of the source of respondent's most recent misuse of prescription drugs were either removed due to data availability issues or were created differently and renamed due to a break in trend.

The variable for the source of last use of methamphetamine (MTHLTSC4) will not be created since methamphetamine is no longer included with the other prescription drugs and the source questions were removed. Additionally, questions asking about the sources of each prescription drug in the past 30 days were removed, resulting in a change in the creation method of the remaining source of last use variables: SRCPNRNM2 (previously ANLLTS2), SRCTRQNM2 (previously TRNLTS2), SRCSTMNM2 (previously STMLTS2), and SRCSEDNM2 (SEDLTS2). Other questionnaire changes that contributed to a trend break for the source of a respondent's most recent misuse of prescription drugs were that the questions were relocated from the Prior Substance Use module to modules pertaining to the use of the specific drug and two response options were removed.

In 2015 and later years, four variables pertain to the source of a respondent's most recent misuse of prescription pain relievers (SRCPNRNM2), prescription tranquilizers (SRCTRQNM2), prescription stimulants (SRCSTMNM2), and prescription sedatives (SRCSEDNM2) within the past year.

For each variable there are 8 mutually exclusive categories for specific sources, and a missing category for respondents with no past year misuse or unknown responses to the source questions. The categories for the specific sources take into account responses from a single question asking about a single, most recent source of misuse among respondents who misused in the past year.

Based on the following conditions, a respondent was classified in one of the following 9 categories (including System missing) for the source of most recent prescription drug misuse in the past year for the variables, SRCPNRNM2, SRCTRQNM2, SRCSTMNM2, and SRCSEDNM2:

1. Got From One Doctor
2. Got From More Than One Doctor
3. Stole from Dr Office, Clinic, Hospital, or Pharmacy
4. Got From Friend or Relative for Free
5. Bought from Friend or Relative
6. Took from Friend or Relative without Asking
7. Bought from Drug Dealer or Other Stranger
8. Got Some Other Way

## RECODED DRUG USE

<u>SRCSEDNM2</u>	Len : 2 RC-SOURCE OF SEDATIVES FOR LAST MISUSE	<b>Freq</b>	<b>Pct</b>
.	= No Past Year Misuse/Unknown/Invalid Source .....	32749	99.56
1	= Got From One Doctor .....	46	0.14
4	= Got From Friend or Relative for Free .....	74	0.22
5	= Bought from Friend or Relative .....	8	0.02
6	= Took from Friend or Relative without Asking .....	9	0.03
7	= Bought from Drug Dealer or Other Stranger .....	3	0.01
8	= Got Some Other Way.....	4	0.01

NOTE: Due to the 2015 questionnaire redesign, measures of the source of a friend's or relative's most recent misuse of prescription drugs were either removed due to data availability or were created differently and renamed due to a break in trend.

The variable for the source of last use of methamphetamine (MTHSRCF2) was not created since methamphetamine is no longer included with the other prescription drugs and the source questions were removed. Additionally, questions asking about friends' or relatives' sources of each prescription drug in the past 30 days were removed, resulting in a change in the creation method of the remaining source of last use variables: SRCFRPNRNM (previously ANLSRCF2), SRCFRTRQNM (previously TRNSRCF2), SRCFRSTMNM (previously STMSRCF2), and SRCFRSEDNM (SEDSRCF2). Other questionnaire changes that contributed to a trend break for the source of a friend's or relative's most recent misuse of prescription drugs were that the questions were relocated from the Prior Substance Use module to modules pertaining to the use of the specific drug and two response options were removed.

In the 2015 and later years questionnaire, a respondent who misused prescription drugs in the past year was administered a question regarding the source of the drug during their most recent use. If they indicated that their most recent source was a 'friend or relative for free' from either of these questions, then a respondent was administered a follow-up question that asked the source the friend/relative had obtained the drug from. The following four variables pertain to the source from which a respondent's friend or relative obtained the drug for prescription pain relievers (SRCFRPNRNM), prescription tranquilizers (SRCFRTRQNM), prescription stimulants (SRCFRSTMNM), and prescription sedatives (SRCFRSEDNM) within the past year.

For each variable there are eight mutually exclusive categories for specific sources that the friend/relative obtained the drug from and a missing category for respondents who did not indicate using the drug in the past year (or lifetime) or a respondent that indicated in one of the previous questions that they had obtained the drug for most recent use from a valid source other than a friend or relative for free and respondents with unknown or invalid values.

Based on the following conditions, a respondent was classified in one of the following nine categories (including System Missing) for the source of most recent prescription drug use in the past year for the variables, SRCFRPNRNM, SRCFRTRQNM, SRCFRSTMNM, and SRCFRSEDNM:

1. Got Prescription(s) from One Doctor (XXXGOTLAS=4 and XXXFFGOT=1, 11)
2. Got Prescription(s) from More Than One Doctor (XXXGOTLAS=4 and XXXFFGOT=2, 12)
3. Stole from Dr Office, Clinic, Hospital, or Pharmacy(XXXGOTLAS=4 and XXXFFGOT=3, 13)
4. Got From Friend or Relative for Free (XXXGOTLAS=4 and XXXFFGOT=4, 14)
5. Bought from Friend or Relative (XXXGOTLAS=4 and XXXFFGOT=5, 15)
6. Took from Friend or Relative without Asking (XXXGOTLAS=4 and XXXFFGOT=6, 16)
7. Bought from Drug Dealer or Other Stranger (XXXGOTLAS=4 and XXXFFGOT=7, 17)
8. Got Some Other Way (XXXGOTLAS=4 and XXXFFGOT=8 and XXXFFGTSP=valid "other" response, levels 9-38, 71)

(System Missing): No Past Year Misuse or Valid Source of Most Recent Misuse Not from Friend or Relative for Free /Unknown/Invalid Source (XXXGOTLAS not=4 or [XXXGOTLAS=4 and XXXFFGOT=94, 97, 98]) or [XXXGOTLAS=4 and XXXFFGOT=8 and XXXFFGTSP=70, 72-75, 85, 94, 97, 98])

<u>SRCFRPNRNM</u>	Len : 2 RC-SOURCE OF FRIEND/RELATIVE PAIN RELIEVERS FOR LAST MISUSE	<b>Freq</b>	<b>Pct</b>

NOTE: OTCFLAG is a "flag" variable that has a value of 1 when respondents reported use of an over-the-counter (OTC) cold medication to get high in the past year, but the only drugs that they specified were prescription-type ones. OTCFLAG has a value of 2 when respondents reported use of OTC cold medications to get high but their "OTHER, Specify" variables COLDYR1 through COLDYR5 all had codes of "bad data" or "blank."

## RECODED SPECIAL DRUGS

### RECODED SPECIAL DRUGS

*The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.*

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

## BLUNTS

**BLUNTS**

The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.

NOTE: When respondents previously reported never using marijuana but reported lifetime use of cigars with marijuana in them (i.e., "blunts"), a consistency check was triggered only when respondents reported using blunts in the past 30 days. Therefore, BLNTEVER was assigned a code of 11 when respondents reported using blunts but they did not report use in the past 30 days, and they previously had reported never using marijuana.

Sometimes people take some tobacco out of a cigar and replace it with marijuana. This is sometimes called a "blunt".

Have you ever smoked part or all of a cigar with marijuana in it?

(BL01)

BLNTEVER<sup>1</sup> Len : 2 EVER SMOKED CIGAR WITH MARIJUANA IN IT

		98 = BLANK (NO ANSWER) .....	281	0.85
		99 = LEGITIMATE SKIP.....	32587	99.07

NOTE: The variable BLNTNOMJ was assigned a code of 5 if respondents were not asked this question because they reported in the TOBACCO module that they smoked cigars in the past 30 days but reported in the BLUNTS module that they did not smoke cigars with marijuana in them in the past 30 days. It could be logically inferred that all of the cigars that these respondents smoked in the past 30 days did not have marijuana in them. BLNTNOMJ was assigned codes of 14 or 24 if respondents were not asked this question and they reported in the BLUNTS module that they smoked a cigar with marijuana in it in the past 30 days. A code of 14 was assigned if respondents reported in the TOBACCO module that they had smoked cigars but not in the past 30 days. A code of 24 was assigned if respondents reported in the TOBACCO module that they had never smoked part or all of a cigar.

Earlier, you reported that you had smoked part or all of a cigar during the past 30 days. During the past 30 days, did you smoke any cigars that did not have marijuana in them?

<i>(BL07)</i>	<u>BLNTNOMJ</u> <sup>1</sup>	Len : 2 SMOKE CIGARS WITH NO MARIJUANA PAST 30 DAYS	<b>Freq</b>	<b>Pct</b>

	99 = LEGITIMATE SKIP.....	6086	18.50

NOTE: Medical marijuana variable MEDMJPA2 replaces variable MEDMJST2 that was created for the 2013 through 2017 NSDUH. MEDMJPA2 is based on the date that a medical marijuana bill was signed into law or an initiative was approved by voters. MEDMJST2 was based on an interpretation of the date when a state's law took effect.

NOTE: MEDMJPA2 indicates whether respondents were living in a State in which a law allowing use of marijuana for medical reasons had been passed at the time of the interview. The entire sample was classified into one of the following two categories: MEDMJPA2 was coded as 1 if the respondent was in a State where a law or initiative allowing the use of marijuana for medical reasons had been passed on or before the interview date; MEDMJPA2 was coded as 2 if (a) the respondent was in a State in which a law or initiative allowing the use of marijuana for medical reasons had not been passed at any time during the survey year; or (b) the respondent was in a State where a law or initiative allowing the use of marijuana for medical reasons had been passed during the survey year but after the interview date.

<u>MEDMJPA2</u>	Len : 1 STATE MEDICAL MJ LAW PASSED AT TIME OF INTERVIEW	<b>Freq</b>	<b>Pct</b>
	1 = In State where medical MJ law passed before intvw.....	23754	72.22
	2 = Not in State where medical MJ law passed by Intvw date .....	9139	27.78

## SUBSTANCE DEPENDENCE AND ABUSE

The next set of variables (through the end of this section) are summary dependence and abuse measures for the drugs and drug families for which trends were broken for recency in the 2015 survey. These drugs / drug families are: hallucinogens, inhalants, methamphetamine, prescription pain relievers, prescription tranquilizers, prescription stimulants, and prescription sedatives. These variables include missing values, while the imputation-revised versions of these variables in which missing values are replaced with valid response categories are described in the "Imputed Substance Dependence and Abuse" section. Analogous versions of these variables for alcohol, marijuana, cocaine, and heroin appear in the "Recoded Substance Dependence and Abuse" section; those variables are presented in that section instead of in this one because they do not have missing values. Instead, respondents with missing values are classified as not having dependence and/or not having abuse. The construction of all dependence and abuse variables is described in more detail in the Nicotine Dependence and Substance Use Disorder appendix.

Respondents who reported lifetime but not past year use of methamphetamine, but were past year users of methamphetamine according to the variable METHNDLRC, were asked the questions on methamphetamine dependence and abuse. Because the editing and imputation procedures for methamphetamine recency do not incorporate METHNDLRC, it is possible for a respondent to be a lifetime but not past year user of methamphetamine according to IRMETHAMREC, but to be classified as having past year dependence or abuse of methamphetamine. The few respondents who were lifetime but not past year users of methamphetamine according to IRMETHAMREC but were missing for METHNDLRC were considered missing for DEPENDMTH and ABUOSMTH, but were considered past year nonusers for their imputation-revised counterparts.

Please note that these abuse variables are unaffected by whether the respondent was defined with dependence (the DEPENDxxx variables), and therefore they do not follow the 4th edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV). They simply indicate whether the respondent met one or more of the four abuse criteria (i.e., whether they "test positive" for abuse). Details can be found in the Nicotine Dependence and Substance Use Disorder appendix.

IMPUTED SUBSTANCE DEPENDENCE AND ABUSE

**IMPUTED SUBSTANCE DEPENDENCE AND ABUSE**

NOTE: The following 17 variables are the imputation-revised versions of the nicotine dependence variables that make up the Nicotine Dependence Syndrome Scale (NDSS). Missing values were only imputed if only one of the 17 variables had a missing value. Users should note that the imputed values for these variables are predicted values from regression models. These predicted values are not integers, and do not correspond directly to the integer responses from the questionnaire. It would be advisable to make the necessary adjustments (such as rounding or otherwise making the non-integer values into integers) when doing cross-tabulations.

IMPUTED SUBSTANCE DEPENDENCE AND ABUSE

The next set of variables (through the end of this section) are imputation-revised summary dependence and abuse measures for the drugs and drug families for which trends were broken for recency in the 2015 survey. These drugs / drug families are: hallucinogens, inhalants, methamphetamine, prescription pain relievers, prescription tranquilizers, prescription stimulants, and prescription sedatives. The analogous versions of these variables that include missing values are described in the "Substance Dependence and Abuse" section. Analogous versions of these variables for alcohol, marijuana, cocaine, and heroin appear in the "Recoded Substance Dependence and Abuse" section; those variables are presented in that section instead of in this one because respondents with missing values are classified as not having dependence and/or not having abuse. The construction of all dependence and abuse variables is described in more detail in the Nicotine Dependence and Substance Use Disorder appendix.

Respondents who reported lifetime but not past year use of methamphetamine, but were past year users of methamphetamine according to the variable METHNDLRC, were asked the questions on methamphetamine dependence and abuse. Because the editing and imputation procedures for methamphetamine recency do not incorporate METHNDLRC, it is possible for a respondent to be a lifetime but not past year user of methamphetamine according to IRMETHAMREC, but to be classified as having past year dependence or abuse of methamphetamine. The few respondents who were lifetime but not past year users of methamphetamine according to IRMETHAMREC but were missing for METHNDLRC were considered past year nonusers.

IMPUTED SUBSTANCE DEPENDENCE AND ABUSE

Please note that these abuse variables are unaffected by whether the respondent was defined with dependence (the IRDEPENDxxx variables), and therefore they do not follow the 4th edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV). They simply indicate whether the respondent met one or more of the four abuse criteria (i.e., whether they "test positive" for abuse). Details can be found in the Nicotine Dependence and Substance Use Disorder appendix.

RECODED SUBSTANCE DEPENDENCE AND ABUSE

**RECODED SUBSTANCE DEPENDENCE AND ABUSE**

NOTE: The variables in this section are recoded variables that were created from one or more of the variables from the following two sections: Substance Dependence and Abuse or Imputed Substance Dependence and Abuse.

NOTE: The following recoded dependence variables were defined based on the dependence criteria according to the Nicotine Dependence Syndrome Scale (NDSS) and the Fagerstrom Test of Nicotine Dependence (FTND) for respondents who reported smoking cigarettes in the past month. The NDSS score, NDSSANSP, is calculated as the average score over 17 questions pertaining to five aspects of dependence. This average score was only computed for those respondents who had a valid response (based on actual reporting and imputation) to all 17 questions. Respondents who did not have valid responses (based on actual reporting and imputation) for all 17 questions were coded as system missing. Based on the NDSS score, a respondent was defined as having nicotine dependence, NDSSDNP=1, if their average score was greater than or equal to 2.75. The FTND measure is defined by assessing how soon after waking a respondent had their first cigarette (CIGWAKE). Based on the FTND scale, a respondent was defined as having nicotine dependence, FTNDDNSP=1, if the first cigarette was smoked within 30 minutes of waking up on the days they smoked (CIGWAKE=1 or 2) and the respondent reported smoking cigarettes in the past month. Based on the NDSS and the FTND, a respondent who reported smoking cigarettes was defined as having nicotine dependence in the past month, DNICNSP=1, if they met either the NDSS or the FTND criteria for dependence. Specific details for each of the nicotine dependence related variables are provided in the Nicotine Dependence and Substance Use Disorder appendix.

## RECODED SUBSTANCE DEPENDENCE AND ABUSE

NOTE: The 2020 NSDUH CAI instrument included questions that were designed to measure illicit drug or alcohol dependence or abuse (i.e., substance use disorders [SUDs]). The SUD questions were based on the criteria in the American Psychiatric Association (APA) Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM IV). Methamphetamine questions were added new to the dependence or abuse module in 2015 and the methamphetamine questions were patterned after questions for cocaine dependence or abuse and were separate from questions for symptoms of dependence or abuse that were related to the misuse of prescription stimulants. SUD recodes based on the DSM-5 use disorder criteria were produced in addition to the DSM-IV recodes (see the Imputed and Recoded DSM-5 Substance Use Disorder sections) and these DSM-5 based recodes were used starting with the 2020 Detailed Tables. Specific details about the DSM-IV dependence or abuse criteria and the DSM-5 use disorder criteria used in these recodes are provided in the Nicotine Dependence and Substance Use Disorder appendix.

Starting with the 2015 NSDUH, changes to the questions in the main modules for hallucinogens, inhalants, methamphetamine, and prescription pain relievers, tranquilizers, stimulants, and sedatives has prompted the start of a new baseline for these measures. These changes also impacted the dependence or abuse questions, prompting a new baseline for the corresponding dependence measures. Additionally beginning in 2015, the dependence measures for these seven substances have been imputed and given new variable names; therefore, they are considered not comparable to similar dependence measures from past years. For all other individual substance measures (marijuana, alcohol, cocaine, and heroin), no changes were applied in 2015 and therefore these measures are considered comparable and have no variable name changes. Summary measures (psychotherapeutics, illicit drugs, or illicit drugs other than marijuana) that include any of the non-comparable measures are also considered not comparable and have new variable names, including the combination dependence or abuse (SUD) measures. Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years.

The dependence measures for inhalants, hallucinogens, pain relievers, tranquilizer, stimulants and sedatives were imputed using the modified predictive mean neighborhoods (modified PMN) procedure (see the MRB Imputation report for more info). The SUD measures for alcohol, marijuana, cocaine, and heroin that remained comparable to prior years had respondents who did not meet the relevant criteria treated the same as a response of "no." In the specific drug documentation, the source variables whether edited or imputed are noted in the variable mapping shown above the variable name.

### DEPENDENCE:

A respondent was defined as having marijuana (DEPNDRJ), inhalant (DEPNDPYINH), hallucinogen (DEPNDPYHAL), or tranquilizer (DEPNDPYTRQ) dependence if the respondent reported a positive response to three or more of the following six dependence criteria:

1. Spent a great deal of time over a period of a month getting, using, or getting over the effects of the substance.
2. Unable to keep set limits on substance use or used more often than intended.
3. Needed to use substance more than before to get desired effects or noticed that using the same amount had less effect than before.
4. Unable to cut down or stop using the substance every time he or she tried or wanted to.
5. Continued to use substance even though it was causing problems with emotions, nerves, mental health, or physical problems.
6. Reduced or gave up participation in important activities due to substance use.

An additional question pertaining to withdrawal symptoms was asked for the following drugs: alcohol, pain relievers, cocaine, heroin, sedatives, stimulants, and methamphetamine. The withdrawal question asked the respondent if they had experienced substance specific withdrawal symptoms at one time that lasted for longer than a day after they cut back or stopped using. The specific number and type of listed withdrawal symptoms varied by substance. A respondent was defined as having alcohol, pain reliever, cocaine, heroin, sedative, stimulant, or methamphetamine dependence (DEPNALC, DEPNDPYNR, DEPNDCC, DEPDHER, DEPNDPYSED, DEPNDPYSTM, DEPNDPYMT) if the respondent reported a positive response to three or more of the seven dependence criteria (including the six standard criteria listed above plus a seventh withdrawal symptom criteria).

Given the current editing and imputation procedures, along with the use of questions in multiple sections of the questionnaire to determine whether or not a respondent was asked the substance dependence and withdrawal questions, it is possible for these dependence recode variables to be inconsistent with the imputed substance use and frequency of use variables. The types of inconsistencies that can occur differ by substance since different combinations of the skip logic criteria were used for each substance. Specific details about these inconsistencies are included in the Nicotine Dependence and Substance Use Disorder appendix.

#### RECODED SUBSTANCE DEPENDENCE AND ABUSE

A respondent was defined as having illicit drug dependence, DEPNPDYILL, if the respondent was classified as dependent (see dependence criteria listed above DEPNDALC) on any of these following substances: marijuana (DEPNDMRJ), hallucinogens (DEPNDPYHAL), inhalants (DEPNDPYINH), methamphetamine (DEPNDPYMTH), tranquilizers (DEPNDPYTRQ), cocaine (DEPNDCCOC), heroin (DEPNDHER), pain relievers (DEPNDPYPNR), stimulants (DEPNDPYSTM), or sedatives (DEPNDPYSED).

*(DEPNDCCOC, DEPNDHER, DEPNDMRJ, DEPNDPYHAL, DEPNDPYINH, DEPNDPYMTH, DEPNDPYPNR, DEPNDPYSED, DEPNDPYSTM, DEPNDPYTRQ)*

DEPNPDYILL Len : 1 RC-ILLICIT DRUG DEPENDENCE - PAST YEAR

	Freq	Pct
0 = No/Unknown (Otherwise).....	31964	97.18
1 = Yes (Any source variable listed above=1) .....	929	2.82

A respondent was defined as having illicit drug other than marijuana dependence, DEPNPDYIEM, if the respondent was classified as being dependent (see dependence criteria listed above DEPNDALC) on any one of these following substances: hallucinogens (DEPNDPYHAL), inhalants (DEPNDPYINH), methamphetamine (DEPNDPYMTH), tranquilizers (DEPNDPYTRQ), cocaine (DEPNDCCOC), heroin (DEPNDHER), pain relievers (DEPNDPYPNR), stimulants (DEPNDPYSTM), or sedatives (DEPNDPYSED). A respondent's marijuana dependency status is not considered in the creation of this variable.

## RECODED SUBSTANCE DEPENDENCE AND ABUSE

NOTE: The 2020 NSDUH CAI instrument included questions that were designed to measure illicit drug or alcohol dependence or abuse (i.e., substance use disorders [SUDs]). The SUD questions were based on the criteria in the American Psychiatric Association (APA) Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM IV). Methamphetamine questions were added new to the dependence or abuse module in 2015 and the methamphetamine questions were patterned after questions for cocaine dependence or abuse and were separate from questions for symptoms of dependence or abuse that were related to the misuse of prescription stimulants. SUD recodes based on the DSM-5 use disorder criteria were produced in addition to the DSM-IV recodes (see the Imputed and Recoded DSM-5 Substance Use Disorder sections) and these DSM-5 based recodes were used starting with the 2020 Detailed Tables. Specific details about the DSM-IV dependence or abuse criteria and the DSM-5 use disorder criteria used in these recodes are provided in the Nicotine Dependence and Substance Use Disorder appendix.

Starting with the 2015 NSDUH, changes to the questions in the main modules for hallucinogens, inhalants, methamphetamine, and prescription pain relievers, tranquilizers, stimulants, and sedatives has prompted the start of a new baseline for these measures. These changes also impacted the dependence or abuse questions, prompting a new baseline for the corresponding abuse measures. Additionally beginning in 2015, the abuse measures for these seven substances have been imputed and given new variable names; therefore, they are considered not comparable to similar abuse measures from past years. For all other individual substance measures (marijuana, alcohol, cocaine, and heroin), no changes were applied in 2015 and therefore these measures are considered comparable and have no variable name changes. Summary measures (psychotherapeutics, illicit drugs, or illicit drugs other than marijuana) that include any of the non-comparable measures are also considered not comparable and have new variable names, including the combination dependence or abuse (SUD) measures. Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years.

The abuse measures for inhalants, hallucinogens, pain relievers, tranquilizer, stimulants, and sedatives were imputed using the modified predictive mean neighborhoods (modified PMN) procedure (see the MRB Imputation report for more info). The abuse measures for alcohol, marijuana, cocaine, and heroin that remained comparable to prior years had respondents who did not meet the relevant criteria treated the same as a response of "no." In the specific drug documentation, the source variables whether edited or imputed are noted in the variable mapping shown above the variable name.

### ABUSE:

A respondent was defined as having alcohol, marijuana, cocaine, heroin, hallucinogen, inhalant, methamphetamine, pain reliever, tranquilizer, stimulant, or sedative abuse (ABUSEALC, ABUSEMRJ, ABUSECOC, ABUSEHER, ABUSEPYHAL, ABUSEPYINH, ABUSEPYMTH, ABUSEPYPNR, ABUSEPYTRQ, ABUSEPYSTM, ABUSEPYSED) if they reported a positive response to one or more of the following four abuse criteria and was determined not to be dependent upon the substance of interest:

1. Respondent reported having serious problems due to substance use at home, work or school.
2. Respondent reported using substance regularly and then did something where substance use might have put them in physical danger.
3. Respondent reported substance use causing actions that repeatedly got them in trouble with the law.
4. Respondent reported having problems caused by substance use with family or friends and continued to use substance even though it was thought to be causing problems with family and friends.

The abuse measures found in this section of the codebook follow the DSM-IV definition of abuse which take into consideration the respondent's dependence criteria as well. A second set of abuse variables that do not take into account dependence but rather simply indicate if the respondent met one or more of the four abuse criteria are available (ABUPOSXX) in the Substance Dependence or Abuse section as well as an imputed version of these variables (IRABUPOSXXX) found in the Imputed Substance Dependence or Abuse section.

Given the current editing and imputation procedures, along with the use of questions in multiple sections of the questionnaire to determine whether or not a respondent was asked the abuse questions, it is possible for these abuse recode variables to be inconsistent with the imputed substance use and frequency of use variables. The types of inconsistencies that can occur differ by substance since different combinations of the skip logic criteria were used for each substance. Specific details about these inconsistencies are included in the Nicotine Dependence and Substance Use Disorder appendix.

In addition, because the dependence and abuse variables are mutually exclusive with dependence taking precedence (i.e., dependence is determined first and respondents are only classified as having abused if they are not already classified as dependent, regardless of responses to the abuse questions), it is possible for the variables showing abuse of a combination of substances to not correspond with the abuse status of those individual substances. For example, a respondent who is classified as having abused cocaine in the past year may be classified as not having abused illicit drugs because they were dependent on marijuana and already classified as being dependent on illicit drugs.

## DSM-5 SUBSTANCE USE DISORDER

### **DSM-5 SUBSTANCE USE DISORDER**

The next set of variables are substance use disorder measures for alcohol and illicit drugs and are based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition. Illicit drugs include marijuana, cocaine, heroin, hallucinogens, inhalants, methamphetamine, and the misuse of prescription psychotherapeutic drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives). These variables include missing values, while the imputation-revised versions of these variables in which missing values are replaced with valid response categories are described in the "Imputed DSM-5 Substance Use Disorder" section. The construction of all SUD variables is described in more detail in the Nicotine Dependence and Substance Use Disorder appendix.

NOTE: Respondents who reported past year alcohol use but indicated use of alcohol on 5 or fewer days in the past year were not asked the questions on alcohol use disorder. However, respondents who reported past year alcohol use and had a missing value for the number of days they used alcohol in the past year were asked the questions on alcohol use disorder. Therefore, it is possible for a respondent to have used alcohol on 5 or fewer days in the past year according to IRALCFY but to be classified as having a past year substance use disorder of alcohol.

(*ALCCUTEV, ALCEMCTD, ALCFMCTD, ALCGTOVR, ALCKPLMT, ALCLOTTM, ALCLSACT, ALCLESEFX, ALCNDMOR, ALCPDANG, ALCPHCTD, ALCSERPB, ALCWD2SX, ALCYR, ALCYRTOT, SDALURGEED*)

**PYUD5ALC**      Len : 2    ALCOHOL USE DISORDER IN THE PAST YEAR

	Freq	Pct
. = Missing: Past year use known or imputed.....	463	1.41
0 = No .....	13738	41.77
1 = Yes.....	3606	10.96
91 = NEVER USED ALCOHOL.....	8381	25.48
93 = DID NOT USE ALCOHOL PAST 12 MONTHS OR USED <6 DAYS .....	6705	20.38

NOTE: Respondents who reported past year marijuana use but indicated use of marijuana on 5 or fewer days in the past year were not asked the questions on marijuana use disorder. However, respondents who reported past year marijuana use and had a missing value for the number of days they used marijuana in the past year were asked the questions on marijuana use disorder. Therefore, it is possible for a respondent to have used marijuana on 5 or fewer days in the past year according to IRMFY but to be classified as having a past year substance use disorder of marijuana.

(*MJYRTOT, MRJCUTEV, MRJEMCTD, MRJFMCTD, MRJGTOVR, MRJKPLMT, MRJLOTTM, MRJLSEFX, MRJNDMOR, MRJPDANG, MRJPHCTD, MRJSERPB, MRJYR, SDMJURGEED, SDMJWDLA1ED, SDMJWDLA2ED, SDMJWDLA3ED, SDMJWDLA4ED, SDMJWDLA5ED, SDMJWDLA6ED, SDMJWDLB1ED, SDMJWDLB2ED, SDMJWDLB3ED, SDMJWDLB4ED, SDMJWDLB5ED, SDMJWDLB6ED*)

**PYUD5MRI**      Len : 2    MARIJUANA USE DISORDER IN THE PAST YEAR

	Freq	Pct
. = Missing: Past year use known or imputed.....	299	0.91
0 = No .....	2898	8.81
1 = Yes.....	2027	6.16
91 = NEVER USED MARIJUANA .....	18051	54.88
93 = DID NOT USE MARIJUANA PAST 12 MONTHS OR USED <6 DAYS .....	9618	29.24

NOTE: Respondents who reported lifetime but not past year use of cocaine, but were past year users of cocaine according to the variable CONDLREC, were asked the questions on cocaine use disorder. Because the editing and imputation procedures for cocaine recency do not incorporate CONDLREC, it is possible for a respondent to be a lifetime but not a past year user of cocaine according to IRCOCREC, but to be classified as having past year substance use disorder of cocaine. The few respondents who were lifetime but not past year users of cocaine according to IRCOCREC but were missing for CONDLREC were considered past year nonusers.

(*COCCUTEV, COCEMCTD, COCFLBLU, COCFMCTD, COCGTOVR, COCKPLMT, COCLOTTM, COCLSACT, COCLSEFX, COCNDMOR, COCPDANG, COCPHCTD, COCSERPB, COCWDL2SX, COCYR, CONDLREC, SDCCURGEED*)

**PYUD5COC**      Len : 2    COCAINE USE DISORDER IN THE PAST YEAR

	Freq	Pct
. = Missing: Past year use known or imputed.....	29	0.09
0 = No .....	557	1.69
1 = Yes.....	137	0.42
91 = NEVER USED COCAINE .....	28987	88.13
93 = DID NOT USE COCAINE IN THE PAST 12 MONTHS .....	3183	9.68

## DSM-5 SUBSTANCE USE DISORDER

NOTE: Respondents who reported lifetime but not past year use of heroin, but were past year users of heroin according to the variables HRNDLREC, HRSMKREC, or HRSNFREC were asked the questions on heroin use disorder. Because the editing and imputation procedures for heroin recency do not incorporate HRNDLREC, HRSMKREC, or HRSNFREC, it is possible for a respondent to be a lifetime but not a past year user of heroin according to IRHERRC, but to be classified as having past year substance use disorder of heroin. The few respondents who were lifetime but not past year users of heroin according to IRHERRC but were missing for HRNDLREC, HRSMKREC, or HRSNFREC were considered past year nonusers.

IMPUTED DSM-5 SUBSTANCE USE DISORDER

**IMPUTED DSM-5 SUBSTANCE USE DISORDER**

The next set of variables are imputation-revised substance use disorder measures for alcohol and illicit drugs and are based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition. Illicit drugs include marijuana, cocaine, heroin, hallucinogens, inhalants, methamphetamine, and the misuse of prescription psychotherapeutic drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives). The construction of all SUD variables is described in more detail in the Nicotine Dependence and Substance Use Disorder appendix.

NOTE: Respondents who reported past year alcohol use but indicated use of alcohol on 5 or fewer days in the past year were not asked the questions on alcohol use disorder. However, respondents who reported past year alcohol use and had a missing value for the number of days they used alcohol in the past year were asked the questions on alcohol use disorder. Therefore, it is possible for a respondent to have used alcohol on 5 or fewer days in the past year according to IRALCFY but to be classified as having a past year substance use disorder of alcohol.

(PYUD5ALC)		Len : 2 ALCOHOL USE DISORDER IN THE PAST YEAR - IMP REV	Freq	Pct

#### IMPUTED DSM-5 SUBSTANCE USE DISORDER

The next set of variables are imputation-revised measures of substance use disorder severity for alcohol and illicit drugs and are based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition. The severity of an SUD according to DSM-5 criteria is determined by the number of individual criteria recorded as positive for a particular substance. Respondents were classified as having an SUD of mild severity if they met two or three SUD criteria for that substance, an SUD of moderate severity if they met four or five SUD criteria for that substance, and a severe SUD if they met six or more SUD criteria for that substance. The construction of all SUD variables is described in more detail in the Nicotine Dependence and Substance Use Disorder appendix.

NOTE: Respondents who reported past year alcohol use but indicated use of alcohol on 5 or fewer days in the past year were not asked the questions on alcohol use disorder. However, respondents who reported past year alcohol use and had a missing value for the number of days they used alcohol in the past year were asked the questions on alcohol use disorder. Therefore, it is possible for a respondent to have used alcohol on 5 or fewer days in the past year according to IRALCFY but to be classified as having a past year substance use disorder of alcohol.

<u>(IRPYUD5ALC)</u>	<u>IRPYSEV5ALC</u>	Len : 2 ALCOHOL USE DISORDER SEVERITY IN THE PAST YEAR - IMP REV	<b>Freq</b>	<b>Pct</b>
		1 = Mild disorder .....	2315	7.04
		2 = Moderate disorder.....	801	2.44
		3 = Severe disorder .....	579	1.76

## RECODED DSM-5 SUBSTANCE USE DISORDER

**RECODED DSM-5 SUBSTANCE USE DISORDER**

NOTE: The variables in this section are recoded variables that were created from one or more of the variables from the following section: Imputed DSM-5 Substance Use Disorder.

NOTE: A respondent is defined as having a past year tranquilizer or sedative use disorder, UDYR5TRQSD, if the respondent was classified as having a past year use disorder for tranquilizers (IRPYUD5TRQ) or sedatives (IRPYUD5SED).

(IRPYUD5SED, IRPYUD5TRQ)

UDYR5TRQSD Len : 1 RC-TRANQUILIZER OR SEDATIVE USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	32754	99.58
1 = Yes.....	139	0.42

NOTE: A respondent is defined as having a past year psychotherapeutic use disorder, UDYR5PSY, if the respondent was classified as having a past year use disorder for pain relievers (IRPYUD5PNR), sedatives (IRPYUD5SED), stimulants (IRPYUD5STM), or tranquilizers (IRPYUD5TRQ).

(IRPYUD5PNR, IRPYUD5SED, IRPYUD5STM, IRPYUD5TRQ)

UDYR5PSY Len : 1 RC-PSYCHOTHERAPEUTIC USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	32475	98.73
1 = Yes.....	418	1.27

NOTE: A respondent is defined as having a past year opioid use disorder, UDYR5OPI, if the respondent was classified as having a past year use disorder for pain relievers (IRPYUD5PNR) or heroin (IRPYUD5HER).

(IRPYUD5HER, IRPYUD5PNR)

UDYR5OPI Len : 1 RC-OPIOID USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	32598	99.10
1 = Yes.....	295	0.90

(IRPYUD5HER, IRPYUD5PNR)

UDYR5HRSNR Len : 1 RC-HEROIN AND/OR PAIN RELIEVER USE DISORDER - PAST YEAR

	Freq	Pct
1 = PST YR HEROIN USE DISORDER (IRPYUD5HER=1 and IRPYUD5PNR=0).....	53	0.16
2 = PST YR PNR USE DISORDER (IRPYUD5HER=0 and IRPYUD5PNR=1).....	211	0.64
3 = PST YR HER & PNR USE DISOR (IRPYUD5HER=1 and IRPYUD5PNR=1).....	31	0.09
4 = NO PST YR HER OR PNR USE DIS (IRPYUD5HER=0 and IRPYUD5PNR=0) .....	32598	99.10

NOTE: A respondent is defined as having a past year CNS stimulant use disorder, UDYR5CNS, if the respondent was classified as having a past year use disorder for cocaine (IRPYUD5COC), methamphetamine (IRPYUD5MTH), or stimulants (IRPYUD5STM).

(IRPYUD5COC, IRPYUD5MTH, IRPYUD5STM)

UDYR5CNS Len : 1 RC-CNS STIMULANT USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	32510	98.84
1 = Yes.....	383	1.16

NOTE: A respondent is defined as having a past year illicit drug use disorder, UDYR5ILL, if the respondent was classified as having a past year use disorder for cocaine (IRPYUD5COC), hallucinogens (IRPYUD5HAL), heroin (IRPYUD5HER), inhalants (IRPYUD5INH), marijuana (IRPYUD5MRJ), methamphetamine (IRPYUD5MTH), pain relievers (IRPYUD5PNR), sedatives (IRPYUD5SED), stimulants (IRPYUD5STM), or tranquilizers (IRPYUD5TRQ).

(IRPYUD5COC, IRPYUD5HAL, IRPYUD5HER, IRPYUD5INH, IRPYUD5MRJ, IRPYUD5MTH, IRPYUD5PNR, IRPYUD5SED, IRPYUD5STM, IRPYUD5TRQ)

UDYR5ILL Len : 1 RC-ILLICIT DRUG USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	30287	92.08
1 = Yes.....	2606	7.92

RECODED DSM-5 SUBSTANCE USE DISORDER

NOTE: A respondent is defined as having a past year illicit drug other than marijuana use disorder, UDYR5IEM, if the respondent was classified as having a past year use disorder for cocaine (IRPYUD5COC), hallucinogens (IRPYUD5HAL), heroin (IRPYUD5HER), inhalants (IRPYUD5INH), methamphetamine (IRPYUD5MTH), pain relievers (IRPYUD5PNR), sedatives (IRPYUD5SED), stimulants (IRPYUD5STM), or tranquilizers (IRPYUD5TRQ).

*(IRPYUD5COC, IRPYUD5HER, IRPYUD5INH, IRPYUD5MTH, IRPYUD5PNR, IRPYUD5SED, IRPYUD5STM, IRPYUD5TRQ)*  
**UDYR5IEM**      Len : 1    RC-ILLICIT DRUG OTHER THAN MRJ USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	32151	97.74
1 = Yes.....	742	2.26

NOTE: A respondent is defined as having a past year illicit drug or alcohol use disorder, UDYR5ILAL, if the respondent was classified as having a past year illicit drug use disorder (UDYR5ILL) or a past year alcohol use disorder (IRPYUD5ALC).

*(IRPYUD5ALC, UDYR5ILL)*  
**UDYR5ILAL**      Len : 1    RC-ILLICIT DRUG OR ALCOHOL USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	27550	83.76
1 = Yes.....	5343	16.24

NOTE: A respondent is defined as having a past year illicit drug and alcohol use disorder, UDYR5ILAAL, if the respondent was classified as having a past year illicit drug use disorder (UDYR5ILL) and a past year alcohol use disorder (IRPYUD5ALC).

*(IRPYUD5ALC, UDYR5ILL)*  
**UDYR5ILAAL**      Len : 1    RC-ILLICIT DRUG AND ALCOHOL USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	31935	97.09
1 = Yes.....	958	2.91

NOTE: A respondent is defined as having a past year illicit drug and no past year alcohol use disorder, UD5ILLNOALC, if the respondent was classified as having a past year illicit drug use disorder (UDYR5ILL) and not a past year alcohol use disorder (IRPYUD5ALC).

*(IRPYUD5ALC, UDYR5ILL)*  
**UD5ILLNOALC**      Len : 1    RC-ILL DRUG USE DISORDER, NO ALC USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	31245	94.99
1 = Yes.....	1648	5.01

NOTE: A respondent is defined as having a past year alcohol and no past year illicit drug use disorder, UD5ALCNOILL, if the respondent was classified as having a past year alcohol use disorder (IRPYUD5ALC) and not a past year illicit drug use disorder (UDYR5ILL).

*(IRPYUD5ALC, UDYR5ILL)*  
**UD5ALCNOILL**      Len : 1    RC-ALC USE DISORDER, NO ILL DRUG USE DISORDER - PAST YEAR

	Freq	Pct
0 = No.....	30156	91.68
1 = Yes.....	2737	8.32

## SPECIAL TOPICS

### SPECIAL TOPICS

*The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.*

The next questions are about encounters with the police or the court system.

Not counting minor traffic violations, have you ever been arrested and booked for breaking the law?

Being "booked" means that you were taken into custody and processed by the police or by someone connected with the courts, even if you were then released.

<i>(SP01)</i> <u>BOOKED</u> <sup>1</sup>	Len : 2 EVER ARRESTED AND BOOKED FOR BREAKING THE LAW	<b>Freq</b>	<b>Pct</b>
1 = Yes.....		3724	11.32
2 = No.....		28587	86.91
3 = Yes LOGICALLY ASSIGNED.....		83	0.25
85 = BAD DATA Logically assigned .....		2	0.01
94 = DON'T KNOW .....		20	0.06
97 = REFUSED .....		58	0.18
98 = BLANK (NO ANSWER) .....		419	1.27

Not counting minor traffic violations, how many times during the past 12 months have you been arrested and booked for breaking a law?

<i>(SP02, SP03S)</i> <u>NOBOOKY2</u> <sup>1</sup>	Len : 3 # TIMES ARRESTED AND BOOKED PAST 12 MONTHS	<b>Freq</b>	<b>Pct</b>
0 = None .....		3248	9.87
1 = One time .....		314	0.95
2 = Two times .....		91	0.28
3 = Three or more times.....		44	0.13
985 = BAD DATA Logically assigned .....		3	0.01
994 = DON'T KNOW .....		12	0.04
997 = REFUSED .....		72	0.22
998 = BLANK (NO ANSWER).....		522	1.59
999 = LEGITIMATE SKIP (BOOKED=2).....		28587	86.91

The next questions are about offenses that are against the law. As you read each question, please answer whether you were arrested and booked for that offense during the past 12 months.

In the past 12 months, were you arrested and booked for motor vehicle theft?

<i>(SP03A)</i> <u>BKMOVTHFT</u> <sup>1</sup>	Len : 2 ARRSTD & BOOKED FOR MOT VEH THEFT PAST 12 MONTHS	<b>Freq</b>	<b>Pct</b>
1 = Yes.....		17	0.05
2 = No.....		456	1.39

	99 = LEGITIMATE SKIP.....	31743	96.50

NOTE: For the variable BKOTH, a code of 3 indicates that respondents did not originally answer "yes" to any of the questions about specific offenses for which they were arrested/booked in the past 12 months, including the question about "some other offense." However, these respondents subsequently specified a valid response for an offense in the past 12 months. A code of 5 in BKOTH indicates that respondents reported being arrested/booked at least once in the past 12 months but did not indicate at least one offense for which they were arrested in that period.

In the past 12 months, were you arrested and booked for some other offense besides these that have been named? Please do not include minor traffic violations.

<i>(SP03Q)</i>	Len : 2 ARRSTD & BOOKED FOR SOME OTHER OFF PAST 12 MOS	Freq	Pct

## RECODED SPECIAL TOPICS

### RECODED SPECIAL TOPICS

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: Starting in 2016, the DUI questions were revised to ask about individual substances instead of illicit drugs or alcohol overall. The driving under the influence variables in this section are not comparable between 2016 and previous years and have been renamed.

<i>(DRVINALCO)</i>	Len : 1 RC-DROVE UNDER INFLUENCE OF ALCOHOL IN PAST YEAR	<b>Freq</b>	<b>Pct</b>

PRIOR SUBSTANCE USE

**PRIOR SUBSTANCE USE**

The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.

NOTE: The variables MRJYRBFR and MRJAGLST were not edited with respect to one another. Therefore, inconsistencies could exist between these two variables.

Earlier questions were about the past 12 months. This question is about the year before that, that is, from [DATEFILL - 12 MONTHS] to [DATEFILL]. During that year, beginning [DATEFILL - 12 MONTHS] and ending [DATEFILL], did you use marijuana or hashish, even once?

(LU01)

MRJYRBFR<sup>1</sup>

NOTE: Respondents were assigned legitimate skip codes of 99 or 89 in CIGYRBFR if they reported in the core TOBACCO module that they last smoked a cigarette more than 3 years ago. Logically, these respondents would not have smoked a cigarette in the past 12 to 24 months. In addition, CIGYRBFR was not edited with respect to CIGAGLST or CIGDLLST. Therefore, inconsistencies could exist between CIGYRBFR and these other variables.

Earlier questions were about the past 12 months. This question is about the year before that, that is, from [DATEFILL - 12 MONTHS] to [DATEFILL]. During that year, beginning [DATEFILL - 12 MONTHS] and ending [DATEFILL], did you smoke part or all of a cigarette, even once?

*(LU37)*

## DRUG TREATMENT

**DRUG TREATMENT**

The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.

NOTE: Respondents were not asked questions in the SUBSTANCE TREATMENT module if they did not report lifetime use of alcohol, marijuana, cocaine, heroin, hallucinogens, inhalants, methamphetamine, or lifetime misuse of prescription psychotherapeutics (pain relievers, tranquilizers, stimulants, or sedatives). Codes of 91 in the edited SUBSTANCE TREATMENT variables indicate that the questions did not apply because respondents never used (or misused) any of these substances.

These next questions deal with treatment for alcohol and drug problems, not including cigarettes. Please report treatment or counseling designed to help you reduce or stop your alcohol or drug use. Please include detoxification and any other treatment for medical problems associated with your alcohol or drug use.

## DRUG TREATMENT

NOTE: NDTXEFFRT was assigned a code of 11 if the respondent originally reported making an effort to obtain treatment but at least one of the following occurred:

- (a) the respondent was logically inferred to have gotten treatment in the past 12 months (TXYRRECV=3); or
- (b) the respondent did not perceive a need for treatment for use of any of the specific drugs that he/she was asked about (i.e., all questions about the perceived need for treatment for specific drugs were answered as "no").

During the past 12 months, did you make an effort to get treatment or counseling for your use of [TXFILL2]?

## DRUG TREATMENT

NOTE: The variables TXALCONLY, TXALCONAG, TXDRGONLY, TXDRGONAG, TXALCDRGU, TXALCDAGE TXDRGALCU, and TXDrgaage pertain to respondents who were lifetime recipients of substance treatment but who had not received treatment in the past year. TXALCONLY and TXALCONAG pertain to respondents who were lifetime alcohol users but had not reported lifetime use of other drugs. TXDRGONLY and TXDRGONAG pertain to respondents who did not report lifetime use of alcohol but reported lifetime use of other drugs. TXALCDRGU, TXALCDAGE TXDRGALCU, and TXDrgaage pertain to respondents who were lifetime users of alcohol and other drugs.

NOTE: TXALCONLY was assigned a value of 11 or 12 when respondents originally reported that they had not received treatment in the past 12 months but they were logically inferred to have received treatment in that period (TXYRRECV=3). Respondents who themselves reported that they had gotten treatment in the past 12 months were asked a different set of questions. However, respondents who reported that they had ever received treatment for their use of alcohol but were logically inferred to have gotten treatment in the past 12 months cannot be inferred to have received alcohol treatment in that period (TXALCONLY=11). TXALCONLY was assigned a value of 22 when respondents were lifetime users of alcohol but had never used (or misused) marijuana, cocaine, heroin, hallucinogens, inhalants, prescription psychotherapeutics (pain relievers, tranquilizers, stimulants, or sedatives), and they reported that they had never received treatment for their use of alcohol.

Earlier you reported that at some time in your life you received treatment or counseling for your use of alcohol or any drug, not counting cigarettes. Have you ever received treatment for your alcohol use?

997 = REFUSED .....	2	0.01
998 = BLANK (NO ANSWER).....	820	2.49
999 = LEGITIMATE SKIP.....	24972	75.92

NOTE: TXALCDRGU and TXDRGALCU were assigned values of 11 or 12 when respondents originally reported that they had not received treatment in the past 12 months but they were logically inferred to have received treatment in that period (TXYRRECVD=3). Respondents who themselves reported that they had gotten treatment in the past 12 months were asked a different set of questions. Thus, for example, respondents who reported that they had ever received treatment for their use of alcohol cannot be inferred to have received alcohol treatment in the past 12 months (TXALCDRGU=11). TXALCDRGU and TXDRGALCU were assigned values of 22 when respondents were lifetime users of both alcohol and other drugs but they reported never receiving treatment for their alcohol use (in the question corresponding to TXALCDRGU) or for their drug use (in the question corresponding to TXDRGALCU).

Earlier you reported that at some time in your life you received treatment or counseling for your use of alcohol or any drug, not counting cigarettes. Have you ever received treatment or counseling for your alcohol use?

## DRUG TREATMENT

NOTE: TXFGALAGE is a "flag" variable that indicates when the first receipt of alcohol treatment in TXALCONAG, TXALCDAGE, TXYALONAG, TXYDROAAG, or TXYALDAAG is inconsistent with the first use of alcohol (from ALCTRY). When TXFGALAGE=5, the respondent previously reported never using alcohol. However, the respondent subsequently reported an age for first receipt of alcohol treatment, based on some indication of alcohol treatment in TXYRALDGB.

### TXFGALAGE<sup>1</sup> Len : 2 CONSISTENCY OF ALC TX AGE WITH ALC AFU

	<b>Freq</b>	<b>Pct</b>
0 = 1st alc tx age consistent with alc AFU .....	948	2.88
1 = 1st alc tx age differs from alc AFU by 1 yr.....	3	0.01

98 = UNKNOWN .....	1041	3.16
99 = LEGITIMATE SKIP.....	23352	70.99

The next question is about self-help groups. Some examples of self-help groups for alcohol or drug use are AA or Alcoholics Anonymous, NA or Narcotics Anonymous, CA or Cocaine Anonymous, and CMA or Crystal Meth Anonymous.

During the past 12 months, did you go to any self-help group meetings or 12-step programs to receive help for your own use of alcohol or any drug, not counting cigarettes?

### (TX52) TXSHGWENT<sup>1</sup> Len : 2 WENT TO SELF-HELP GRP/12-STEP PGMS PAST 12 MOS

	<b>Freq</b>	<b>Pct</b>
1 = Yes.....	282	0.86
2 = No.....	24445	74.32
5 = Yes LOGICALLY ASSIGNED (from skip pattern) .....	212	0.64
85 = BAD DATA Logically assigned .....	15	0.05
91 = NEVER USED ALCOHOL OR DRUGS .....	7090	21.55
94 = DON'T KNOW .....	17	0.05
97 = REFUSED .....	31	0.09
98 = BLANK (NO ANSWER) .....	801	2.44

## DRUG TREATMENT

Did you go to the self-help group because of your alcohol use only, your drug use only, or because of both alcohol and drug use?

*(TX53)*

TXSHGALDB<sup>1</sup>

Len : 2 WENT TO SELF-HELP GRP FOR ALC ONLY/DRUG ONLY/BOTH

	<b>Freq</b>	<b>Pct</b>
1 = Alcohol use only.....	120	0.36
2 = Drug use only.....	55	0.17
3 = Both alcohol and drug use.....	106	0.32
11 = Alcohol use only LOGICALLY ASSIGNED (TXYRSLFAD=1) .....	4	0.01
12 = Drug use only LOGICALLY ASSIGNED (TXYRSLFAD=2).....	5	0.02
13 = Both alcohol and drug use LOG ASSN (TXYRSLFAD=3).....	51	0.16
91 = NEVER USED ALCOHOL OR DRUGS .....	7090	21.55
94 = DON'T KNOW .....	1	0.00
97 = REFUSED .....	31	0.09
98 = BLANK (NO ANSWER) .....	847	2.58
99 = LEGITIMATE SKIP.....	24583	74.74

NOTE: TXSHGFLAG compares the consistency of data in the self-help group variable TXSHGWENT and the self-help group variable TXYRSLFHP. TXSHGFLAG has a value of 1 when TXSHGWENT was answered as "yes" but TXYRSLFHP indicates that respondents did not receive treatment in a self-help group, even though they reported that they received treatment in the past 12 months. TXSHGFLAG has a value of 2 when TXSHGWENT was answered as "yes" but TXYRRECVD or TXEVRRCD indicated that respondents never received any treatment in the past 12 months or lifetime, respectively. TXSHGFLAG has a value of 3 when TXSHGWENT was not answered as "yes" but TXYRSLFHP indicates that respondents were logically inferred to have gotten treatment in a self-help group in the past 12 months. TXSHGFLAG has a value of 4 when TXSHGWENT was answered as "yes" but TXYRSLFHP was answered as "don't know" or "refused" or it was blank. Finally, TXSHGFLAG has a value of 5 when TXSHGWENT was answered as "don't know" or "refused" but TXYRSLFHP was answered as "no."

TXSHGFLAG<sup>1</sup>

98 = BLANK (NO ANSWER) .....	25515	77.57

## RECODED DRUG TREATMENT

### **RECODED DRUG TREATMENT**

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: The variables in this section are recoded variables that were created from one or more of the variables from three of the preceding sections: Drug Treatment, Recoded Substance Dependence and Abuse, or Recoded DSM-5 Substance Use Disorder.

NOTE: Changes to the modules for hallucinogens, inhalants, methamphetamine, and prescription psychotherapeutic drugs in 2015 might have affected the sets of respondents who were eligible to be asked the questions about treatment for substance use. Therefore, all of the variables in the Substance Use Treatment module have been renamed for 2015 and future years. For detailed information about comparability decisions, see the two-volume 2015 Questionnaire Redesign Impact Assessment, Final Report, within the 2015 Methodological Resource Book (Center for Behavioral Health Statistics and Quality, 2017).

NOTE: The following seven recoded variables contain information about receiving treatment at any location in lifetime or in the past year.

<i>(TXEVRRCDV)</i>	Len : 1 RC-RCVD TRT ANY LOC FOR ILL DRG OR ALC USE IN LIFETIME	<b>Freq</b>	<b>Pct</b>

#### RECODED DRUG TREATMENT

A respondent was classified as receiving treatment in the past year for alcohol use but not illicit drug use at a specialty facility, TXYSPALNIL, that is a hospital (inpatient), a rehabilitation facility (in or outpatient), or at a mental health center if they met one of the following conditions:

1. Reported receiving only alcohol treatment in the past year (TXYRALDGB=1) and that treatment was received at a specialty facility (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).
2. Reported receiving only alcohol treatment in the past year but also reported receiving treatment for illicit drug use during their last or current treatment (TXYRALDGB=11), the reported alcohol treatment was received at one of the four specialty facilities (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86), and their last or current treatment was not at one of the four specialty facilities (TXLTCURRSP=0).
3. Reported receiving both illicit drug and alcohol treatment in the past year (TXYRALDGB=3, 6) and reported specifically receiving only alcohol treatment at one of the four specialty facilities in the follow-up questions (TXYRHOSAD=1 or TXYRRESAD=1 or TXYROUTAD=1 or TXYRMHCAD=1 or (TXYROTHAD=1 and TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86)) but did not report specifically receiving illicit drug treatment or illicit drug and alcohol treatment at one of the four specialty facilities in the follow-up questions (TXYRHOSAD NE 2, 3 or TXYRRESAD NE 2, 3 or TXYROUTAD NE 2, 3 or TXYRMHCAD NE 2, 3 or TXYROTHAD NE 2, 3 and TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86) or TXYROTHSP2 NE 21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).

For the logically assigned levels of TXYRALDGB, the creation of this variable may be unclear; therefore, details for classifying respondents as not receiving alcohol only treatment at a specialty facility for these logically assigned levels are below:

1. Reported receiving alcohol treatment in the past year but illicit drug treatment status is unknown (TXYRALDGB=4) or reported receiving illicit drug treatment in the past year but alcohol treatment status is unknown (TXYRALDGB=5).
2. Reported receiving only illicit drug treatment in the past year but also reported receiving treatment for alcohol during their last or current treatment (TXYRALDGB=12).
3. Reported receiving only alcohol treatment in the past year but also reported receiving treatment for illicit drug use during their last or current treatment (TXYRALDGB=11) and the reported alcohol treatment was not at a specialty facility (TXYRHOSOV=2, 94, 97, 98 and TXYRRESOV=2, 94, 97, 98 and TXYROUTPT=2, 94, 97, 98 and TXYRMHCOP=2, 94, 97, 98 and TXYROTHSP2 NE 21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).
4. Reported receiving only alcohol treatment in the past year but also reported receiving treatment for illicit drug use during their last or current treatment (TXYRALDGB=11) and their reported alcohol treatment was at a specialty facility (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86) but their last or current treatment was at a specialty facility (TXLTCURRSP=1) and included treatment for illicit drug use.

(TXLTCURRSP, TXYRALDGB, TXYRHOSAD, TXYRHOSOV, TXYRMHCAD, TXYRMHCOP, TXYROTHAD, TXYROTHSP2, TXYROUTAD, TXYROUTPT, TXYRRESAD, TXYRRESOV)

#### RECODED DRUG TREATMENT

A respondent was classified as receiving treatment in the past year for illicit drug use but not alcohol use at a specialty facility, TXYSPILNAL, that is a hospital (inpatient), a rehabilitation facility (in or outpatient), or at a mental health center if they met one of the following conditions:

1. Reported receiving only illicit drug treatment in the past year (TXYRALDGB=2) and that treatment was received at a specialty facility (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).
2. Reported receiving only illicit drug treatment in the past year but also reported receiving treatment for alcohol use during their last or current treatment (TXYRALDGB=12), the reported illicit drug treatment was received at one of the four specialty facilities (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86), and their last or current treatment was not at one of the four specialty facilities (TXLTCURRSP=0).
3. Reported receiving both illicit drug and alcohol treatment in the past year (TXYRALDGB=3, 6) and reported specifically receiving only illicit drug treatment at one of the four specialty facilities in the follow-up questions (TXYRHOSAD=2 or TXYRRESAD=2 or TXYROUTAD=2 or TXYRMHCAD=2 or (TXYROTHAD=2 and TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86)) but did not report specifically receiving alcohol treatment or illicit drug and alcohol treatment at one of the four specialty facilities in the follow-up questions (TXYRHOSAD NE 1, 3 or TXYRRESAD NE 1, 3 or TXYROUTAD NE 1, 3 or TXYRMHCAD NE 1, 3 or TXYROTHAD NE 1, 3 and TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86) or TXYROTHSP2 NE 21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).

For the logically assigned levels of TXYRALDGB, the creation of this variable may be unclear; therefore, details for classifying respondents as not receiving illicit drug only treatment at a specialty facility for these logically assigned levels are below:

1. Reported receiving alcohol treatment in the past year but illicit drug treatment status is unknown (TXYRALDGB=4) or reported receiving illicit drug treatment in the past year but alcohol treatment status is unknown (TXYRALDGB=5).
2. Reported receiving only alcohol treatment in the past year but also reported receiving treatment for illicit drugs during their last or current treatment (TXYRALDGB=11).
3. Reported receiving only illicit drug treatment in the past year but also reported receiving treatment for alcohol use during their last or current treatment (TXYRALDGB=12) and the reported illicit drug treatment was not at a specialty facility (TXYRHOSOV=2, 94, 97, 98 and TXYRRESOV=2, 94, 97, 98 and TXYROUTPT=2, 94, 97, 98 and TXYRMHCOP=2, 94, 97, 98 and TXYROTHSP2 NE 21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86).
4. Reported receiving only illicit drug treatment in the past year but also reported receiving treatment for alcohol use during their last or current treatment (TXYRALDGB=12) and their reported illicit drug treatment was at a specialty facility (TXYRHOSOV=1, 3, 5 or TXYRRESOV=1, 3, 5 or TXYROUTPT=1, 3, 5 or TXYRMHCOP=1, 3, 5 or TXYROTHSP2=21, 22, 23, 24, 45, 46, 56, 64, 76, 81, 86) but their last or current treatment was at a specialty facility (TXLTCURRSP=1) and included treatment for alcohol use.

## RECODED DRUG TREATMENT

NOTE: The following 27 recoded variables contain information about where a respondent received treatment in the past year.

NOTE: The following nine recoded variables contain information about where a respondent received alcohol use treatment in the past year.

A respondent received treatment for alcohol use in the past year at the specified location if they met either of these conditions:

1. Received treatment in the past 12 months for both illicit drug and alcohol use (TXYRALDGB=3, 6) and reported a positive response to the specific treatment location (TXYRXXXXX=1, 3, 5) and reported receiving treatment at the specific location for alcohol use or both illicit drug and alcohol use (TXYRXXXAD=1, 3).
2. Received treatment in the past 12 months for alcohol use only (including respondents with unknown illicit drug use treatment and respondents who reported last treatment for illicit drugs) (TXYRALDGB=1, 4, 11) and reported a positive response to the specific treatment location (TXYRXXXXX=1, 3, 5).

## RECODED DRUG TREATMENT

NOTE: The following nine recoded variables contain information about where a respondent received illicit drug use treatment in the past year.

A respondent received treatment for illicit drug use in the past year at the specified location if they met either of these conditions:

1. Received treatment in the past 12 months for both illicit drug and alcohol use (TXYRALDGB=3, 6) and reported a positive response to the specific treatment location (TXYRXXXX=1, 3, 5) and reported receiving treatment at the specific location for illicit drug use or both illicit drug and alcohol use (TXYRXXXAD=2, 3).
2. Received treatment in the past 12 months for illicit drug use only (including respondents with unknown alcohol use treatment and respondents who reported last treatment for alcohol) (TXYRALDGB=2, 5, 12) and reported a positive response to the specific treatment location (TXYRXXXX=1, 3, 5).

## RECODED DRUG TREATMENT

NOTE: The following six recoded variables contain information about a respondent's need for treatment in the past year. TXYRNDALC, TXYRNDILL, and TXYRNDILAL are based on DSM-IV dependence or abuse criteria. TXND5YRALC, TXND5YRILL, and TXND5YRILAL are based on DSM-5 use disorder criteria; recodes based on DSM-5 use disorder criteria were used starting with the 2020 Detailed Tables. Specific information about the DSM-IV dependence or abuse criteria and the DSM-5 use disorder criteria used in these recodes can be found in the Nicotine Dependence and Substance Use Disorder Appendix.

A respondent was classified as needing treatment for alcohol use in the past year, TXYRNDALC, if they met at least one of the following three criteria:

1. Dependent on alcohol in the past year (based on DSM-IV criteria) (DEPNDALC=1).
2. Alcohol abuse in the past year (based on DSM-IV criteria) (ABUSEALC=1).
3. Received treatment for alcohol use at a specialty facility in the past year including a hospital (inpatient), rehabilitation facility (in or outpatient), or mental health center (TXYRSPALC=1).

#### RECODED DRUG TREATMENT

The following variable, NDTRNMIMPT, was assigned a positive response if a respondent felt a need for substance use treatment in the past year (NDFLTXILAL=1) and reported the reason for not receiving treatment or not receiving additional treatment as some other reason than the 14 reasons listed above (NDTXMIMPT or NDMRMIMPT=16-33, 35-69). A negative response was assigned if a respondent felt a need for substance use treatment in the past year (NDFLTXILAL=1) but did not meet the above criteria for some other reason (NDTXMIMPT or NDMRMIMPT not equal to 16-33, 35-69).

NOTE: If respondents reported that they last smoked cigarettes, used smokeless tobacco, or smoked cigars more than 12 months prior to their interview date and they did not smoke pipe tobacco in the past 30 days (or never smoked pipe tobacco), codes of 93 in HPQTTOB indicate that these respondents had not used tobacco products in the past 12 months. Respondents who smoked tobacco in a pipe in their lifetime were asked whether they did so in the past 30 days but they were not asked whether they smoked tobacco in a pipe more than 30 days ago but within the past 12 months. If respondents reported never using tobacco products or not using them in the past 12 months (including not smoking tobacco in a pipe in the past 30 days) and also that they did not have any health care visits in the past 12 months (emergency room visits, overnight hospitalizations, or outpatient visits, or telehealth encounters), indication that these respondents had not used tobacco products in the past 12 months or in their lifetime (as indicated by codes of 91 or 93) took precedence over assignment of codes to indicate that these respondents did not have any health care visits in the past 12 months. Codes of 99 in HPQTTOB applied to respondents who used tobacco products in the past 12 months or whose status as a tobacco user in the past 12 months was unknown but who did not have any health care visits in the past 12 months.

During the past 12 months, did any doctor or other health care professional advise you to quit smoking cigarettes or quit using any other tobacco products?

## RECODED HEALTH

**RECODED HEALTH**

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

ADULT MENTAL HEALTH SERVICE UTILIZATION

**ADULT MENTAL HEALTH SERVICE UTILIZATION**

*The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.*

NOTE: This variable incorporates the value from a probe question that was asked when the respondent answered REFUSED to this question.

These next questions are about treatment and counseling for problems with emotions, nerves or mental health. Please do not include treatment for alcohol or drug use.

During the past 12 months, have you stayed overnight or longer in a hospital or other facility to receive treatment or counseling for any problem you were having with your emotions, nerves, or mental health? Please do not include treatment for alcohol or drug use.

NOTE: This variable incorporates the value from a probe question that was asked when the respondent answered REFUSED to this question.

The list below includes some of the places where people can get outpatient treatment or counseling for problems with their emotions, nerves, or mental health.

During the past 12 months, did you receive any outpatient treatment or counseling for any problem you were having with your emotions, nerves, or mental health at any of the places listed below? Please do not include treatment for alcohol or drug use.

- An outpatient mental health clinic or center
- The office of a private therapist, psychologist, psychiatrist, social worker, or counselor that was not part of a clinic
- A doctor's office that was not part of a clinic
- An outpatient medical clinic
- A partial day hospital or day treatment program
- Some other place

## ADULT MENTAL HEALTH SERVICE UTILIZATION

Earlier, we asked whether you have received prescription medicines, inpatient treatment or outpatient treatment for your emotions, nerves or mental health. The list below contains possible sources of treatment, counseling or support that were not mentioned before.

Acupuncturist or acupressurist  
 Chiropractor  
 Herbalist  
 In-person support group or self-help group  
 Internet support group or chat room  
 Spiritual or religious advisor, such as a pastor, priest, rabbi  
 Telephone hotline  
 Massage therapist

Did you receive treatment, counseling or support from any other sources such as these during the past 12 months?

## RECODED ADULT MENTAL HEALTH SERVICE UTILIZATION

### RECODED ADULT MENTAL HEALTH SERVICE UTILIZATION

NOTE: The variables in this section are recoded variables that were created from one or more variables from the following sections: Adult Mental Health Service Utilization and Recoded Drug Treatment.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

<i>(AUINPYR)</i> <u>AMHINP2</u>	Len : 1 RC-RCVD INPATIENT MENTAL HEALTH TRT IN PST YR	Freq	Pct
.	= Unknown/Aged 12-17/Log Assign Yes (Otherwise) .....	6429	19.55
1	= Yes (AUINPYR=1) .....	248	0.75
2	= No (AUINPYR=2).....	26216	79.70

The following variable for received outpatient mental health treatment/counseling in the past year, AMHOUTP3, has the logically assigned yes level, AUOPTYR=3, defined as a system missing. This differs from how this variable was defined originally on the 2010 to 2016 NSDUHs which had the logically assigned yes level, AUOPTYR=3, defined as a positive response as long as the respondent did not indicate an alternative source or invalid outpatient location as their only outpatient treatment location. The revised version of this variable was used starting with the 2017 Detailed Tables and the revision was retroactively applied to the 2010 to 2016 variables; therefore, the 2010 to 2016 estimates for the receiving outpatient mental health treatment/counseling in the 2017 Detailed Tables may differ from previously published estimates. The revised version of this variable is not included on currently available data files prior to the 2017 NSDUH but will be included on future releases of the 2010 to 2016 data files. In future releases of the 2010 to 2016 data files, the original version of the variable used in the 2016 Detailed Tables will be renamed as AMHOUTP3\_O to allow previously published estimates to be reproduced. The original version of this variable is not included on the 2017 or later data files.

AMHOUTP3 is defined as system missing if a respondent reported receiving outpatient mental health treatment/counseling in the past year at only "Some Other Place" (AUOPTYR=1 and only AUOPOTOP=1, 3) and their write-in response was classified as an invalid outpatient mental health treatment/counseling location or alternative treatment/support (AUOPYRS2=7, 8, 10, 11, 17, 22, 26, 30, 34, 35, 36, 37, 38, 39, 42, 45, 48, 49, 50, 51, 54, 55, 56, 59, 71, 72, 73, 75, 76). In addition to the responses described above, respondents aged 12-17 and those coded as logically assigned yes, bad data, legitimate skip, don't know, refused, or blank (AUOPTYR=3, 85, 89, 94, 97, 98, 99) were also defined as system missing. A respondent was assigned a positive response if they indicated they had received outpatient mental health treatment/counseling in the past year (AUOPTYR=1) and they did not indicate an alternative source or invalid outpatient location (AUOPYRS2 not =7, 8, 10, 11, 17, 22, 26, 30, 34, 35, 36, 37, 38, 39, 42, 45, 48, 49, 50, 51, 54, 55, 56, 59, 71, 72, 73, 75, 76) as their only location for outpatient treatment.

## RECODED ADULT MENTAL HEALTH SERVICE UTILIZATION

The following variable, AMHESVTYP, classifies what type of mental health treatment/counseling was received in the past year. Respondents who reported receiving treatment for mental health were classified in one of seven mutually exclusive categories. A respondent was assigned to level one if they reported receiving inpatient treatment only (AMHINP2=1 and AMHOUTP3=2 and AMHRX2=2), to level two if they reported receiving outpatient treatment only (AMHINP2=2 and AMHOUTP3=1 and AMHRX2=2), to level three if they reported receiving prescription medication treatment only (AMHINP2=2 and AMHOUTP3=2 and AMHRX2=1), to level four if they reported receiving both inpatient and outpatient treatment only (AMHINP2=1 and AMHOUTP3=1 and AMHRX2=2), to level five if they reported receiving inpatient and prescription medication treatment only (AMHINP2=1 and AMHOUTP3=2 and AMHRX2=1), to level six if they reported receiving outpatient and prescription medication treatment only (AMHINP2=2 and AMHOUTP3=1 and AMHRX2=1), or to level seven if they reported receiving inpatient, outpatient, and prescription medication treatment (AMHINP2=1 and AMHOUTP3=1 and AMHRX2=1). Respondents who did not receive mental health treatment in the past year were assigned to level eight (AMHINP2=2 and AMHOUTP3=2 and AMHRX2=2). Respondents whose specific treatment was not distinguishable due to missing values in one or more of the three source variables (AMHINP2, AMHOUTP3, or AMHRX2) were assigned a system missing.

NOTE: The following seven variables contain information about the location of outpatient mental health treatment/counseling received in the past year. These variables were revised for the 2009 NSDUH to include those respondents who reported receiving NO outpatient mental health treatment (AMHOUTP3=2) in the No category for the location. This differs from the variables named similarly in the past as they were only defined for those respondents who reported having received outpatient mental health treatment in the past year (AMHOUTP3=1) and those respondents who reported NO outpatient mental health treatment were previously defined as system missing.

Only respondents who reported having received outpatient mental health treatment/counseling (AMHOUTP3=1) can be defined as having received it at the location. A respondent was allowed to report any of five specific locations or "Some Other Place". If a respondent reported "Some Other Place," they were asked to provide a description of the other location in a follow-up question. The first five variables below were created by examination of the variables containing information on the five specific locations, while the last two variables were created by examination of the variables containing information on the other-specify locations which were grouped into two main categories.

NOTE: The following variables, MHLSCHL3 and MHLOTH3, were created by examination of the other-specify write-in responses for locations where a respondent received outpatient mental health treatment/counseling. See additional information included above the location of outpatient mental health treatment recode variable, MHLMNT3.

The following variable, MHLSCHL3, was assigned a positive response if a respondent indicated receiving outpatient mental health treatment/counseling in the past year (AMHOUTP3=1) at some location other than the five locations defined above (AUOPOTOP=1) and the location was classified as "School or University Setting/Clinic/Center" (AUOPYRS2=9). A negative response was assigned if the respondent indicated receiving outpatient mental health treatment/counseling in the past year (AMHOUTP3=1) at one of the five locations defined above but not some location other than these five locations (AUOPOTOP=6 AND AUOPYRS2=99), at some location other than the five locations defined above or "School or University Setting/Clinic/Center" and this location was classified as a valid outpatient treatment location (AUOPYRS2=1-6, 12, 13, 14, 15, 16, 18, 19, 20, 21, 23, 24, 25, 27, 28, 29, 31, 32, 33, 40, 41, 44, 46, 47, 52, 53, 57, 58, 60-70,77), or if they did not receive outpatient mental health treatment in the past year (AMHOUTP3=2). Respondents who indicated receiving outpatient treatment in the past year (AMHOUTP3=1) at some location other than the five locations defined above (AUOPOTOP=1) and the location was classified as an invalid or alternative source of treatment (AUOPYRS2=7, 8, 10, 11, 17, 22, 26, 30, 34-39, 42, 45, 48-51, 54, 55, 56, 59, 71, 72, 73, 75, 76), bad data, don't know, refused, or blank (AUOPYRS2=85, 94, 97, 98), aged 12-17 (AUOPYRS2=89, 99 and AMHOUTP3=.), or classified as missing for receiving outpatient treatment in the past year (AMHOUTP3=.) were set to SAS missing.

## RECODED ADULT MENTAL HEALTH SERVICE UTILIZATION

The following variable, MHLOTH3, was assigned a positive response if a respondent indicated receiving outpatient mental health treatment/counseling in the past year (AMHOUTP3=1) at some location other than the six locations defined above and was classified as a valid location for outpatient mental health treatment/counseling and not considered an alternative source of treatment (AUOPOTOP=1 and AUOPYRS2=12-16, 18-21, 23, 24, 25, 27, 28, 29, 31, 32, 33, 40, 41, 44, 46, 47, 52, 53, 57, 58, 60-70, 77). A negative response was assigned if the respondent indicated receiving outpatient mental health treatment/counseling in the past year (AMHOUTP3=1) at one of the first five specified locations but not some location other than these locations (AUOPOTOP=6 and AUOPYRS2=99), indicated some other location to be one of the six specified locations defined above (AUOPYRS2=1-6, 9, 43), provided a name of a facility (AUOPYRS2=70) as the 'other' location, or if reported not receiving outpatient mental health treatment in the past year (AMHOUTP3=2). Respondents who indicated receiving outpatient treatment in the past year (AMHOUTP3=1) at some location other than the five locations defined above (AUOPOTOP=1) and the location was classified as an invalid or alternative source of treatment (AUOPYRS2=7, 8, 10, 11, 17, 22, 26, 30, 34-39, 42, 45, 48-51, 54, 55, 56, 59, 71, 72, 73, 75, 76), bad data, don't know, refused, or blank (AUOPYRS2=85, 94, 97, 98), aged 12-17 (AUOPYRS2=89, 99 and AMHOUTP3=.), or classified as missing for receiving outpatient treatment in the past year (AMHOUTP3=.) were set to SAS missing.

 NOTE: The following 15 variables contain information about the reasons for not receiving mental health treatment/counseling that was needed in the past year. A respondent must have reported not receiving mental health treatment that was needed in the past year (AMHTXND2=1) in order to be asked the questions on the reason for not receiving treatment. A respondent was allowed to report any of eight specific reasons or "Some Other Reason." If a respondent reported "Some Other Reason," they were allowed to report any of six additional specific reasons or report "Some Other Reason" again. If a respondent reported "Some Other Reason" again, they were then asked to provide the most important other reason in a followup question. The first 14 variables below were created by examination of the variables containing information on the 14 specific reasons; while the last two variables were created by examination of the most important other-specify reasons.

## YOUTH EXPERIENCES

Now think about the past 12 months, that is, from [DATEFILL] through today. During the past 12 months, have you talked with at least one of your parents about the dangers of tobacco, alcohol, or drug use? By parents, we mean either your biological parents, adoptive parents, stepparents, or adult guardians -- whether or not they live with you.

*(YE08)*

## RECODED MENTAL HEALTH

### RECODED MENTAL HEALTH

NOTE: The variables in this section are recoded variables that were created from one or more variables from the following three sections: Mental Health, Recoded Substance Dependence and Abuse, and Recoded DSM-5 Substance Use Disorder.

Recoded variables were defined to measure psychological distress, Serious Mental Illness (SMI) and other levels of mental illness, as well as suicide ideation. A logistic regression model revised in 2012 is used to determine the predicted probability of SMI. The predicted mental illness variables (e.g., SMIYR\_U, AMIYR\_U) that were derived from the 2012 model were examined to determine how they were associated with the mental health predictor variables in the 2012 model. It was found that the 2012 model significantly overestimated the proportion of adults aged 18 or older with SMI (and those with AMI) who had suicidal thoughts in the past year and also the proportion of adults who had MDE in the past year. Therefore, it is recommended that the mental illness variables derived from the 2012 model should not be used when analyzing past year suicidal thoughts, past year MDE, or other associated variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, or lifetime MDE). Similarly, it is recommended that model-based mental illness variables should not be used in conjunction with the K6 variables (including serious psychological distress) or WHODAS variables in any analyses. Specific details about the creation and use of the distress and mental illness variables can be found in the Recoded Mental Health Appendix.

NOTE: The following five variables contain information about psychological distress. The 2008 NSDUH was the first survey year where variables on past month psychological distress (K6SCMON and SPDMON) were available and these variables were used beginning with the 2008 Detailed Tables. A second set of variables describes past year psychological distress (K6SCYR, K6SCMAX, and SPDYR). The past year distress variables, K6SCMAX and SPDYR, were created based on data from the past month K6 items and the worst month in the past year K6 items. Prior to the 2008 NSDUH, past year distress was based only on the worst month in the past year K6 items (SPD\_UADJ). Due to the addition of the past month K6 items, it was determined that past year SPD in 2008 and later years is not comparable with years prior to 2008. In order to be able to make comparisons of SPD estimates across years, statistically adjusted variables were created for 2005-2007. The 2005-2007 adjusted past year SPD recodes, K6SMXADJ and SPDYRADJ, can be renamed to the 2008 SPD variable names for use in analyses that use data from 2005 and subsequent years.

The following variable, K6SCMON, is a score with values ranging from 0 to 24 indicating the level of psychological distress over the past 30 days (past month). This variable is based on data collected from a series of six questions known as the K6, asking adult respondents how frequently they experienced symptoms of psychological distress during the past 30 days. These questions include the following symptoms of distress: feeling nervous (DSTNRV30), feeling hopeless (DSTHOP30), feeling restless or fidgety (DSTRST30), feeling so sad or depressed that nothing could cheer you up (DSTCHR30), feeling that everything was an effort (DSTEFF30), and feeling down on yourself, no good, or worthless (DSTNGD30). For each of the six items listed above, responses of "all of the time" were coded 4, "most of the time" were coded 3, "some of the time" were coded 2, "a little of the time" were coded 1, and "none of the time" and all other responses were coded 0. These assigned values were summed across the six items to calculate a total score for K6SCMON. Specific details about this variable are provided in the Recoded Mental Health Appendix.

0 = No (K6SCMON<13) .....	24443	74.31
1 = Yes (K6SCMON>=13).....	2727	8.29

NOTE: The two variables directly above are defined based on questions asking about a respondent's level of psychological distress over the past 30 days. Respondents were then asked if there was a month in the past 12 months when they felt more depressed, anxious, or emotionally stressed than they felt in the past 30 days. This level of psychological distress is referenced as the "worst month in past year" in the following documentation.

The following variable, K6SCYR, is a score with values ranging from 0 to 24 indicating the level of psychological distress during the worst month of the past year, that was not the past 30 days. This variable is only defined for respondents who reported that there was a month in the past 12 months when he/she was more depressed, anxious, or emotionally stressed than during the past 30 days (DSTWORST=1). This score variable is based on a series of six questions asking respondents how frequently they experienced symptoms of psychological distress during their worst month in the past year (only if the worst month was not the past 30 days). These questions are from the K6 and include the following symptoms of distress: feeling nervous (DSTNRV12), feeling hopeless (DSTHOP12), feeling restless or fidgety (DSTRST12), feeling so sad or depressed that nothing could cheer them up (DSTCHR12), feeling that everything was an effort (DSTEFF12), and feeling down on themselves, no good, or worthless (DSTNGD12). For each of the six items listed above, responses of "all of the time" were coded 4, "most of the time" were coded 3, "some of the time" were coded 2, "a little of the time" were coded 1, and "none of the time" and all other responses were coded 0. These assigned values were summed across the six items to calculate a total score for K6SCYR. For respondents who indicated that they did not have a month in the past year worse than the past 30 days, K6SCYR was set to missing. Specific details about this variable are provided in the Recoded Mental Health Appendix.

## RECODED MENTAL HEALTH

The following variable, K6SCMAX, is defined to be the higher K6 score between the past month K6 total score (K6SCMON) variable, and the K6 total score in the worst month of the past year if the worst month was not the past 30 days (K6SCYR) variable.

0	= No .....			26003	79.05
1	= Yes .....			198	0.60

NOTE: The following 10 variables pertain to the creation of the variables on mental illness. These variables include total scores from the psychological distress and impairment scales, the predicted probability of serious mental illness (SMI), and indicators of various levels of mental illness. Until 2012, a model developed for the 2008 NSDUH was used to determine mental illness status. A revised and improved model predicting mental illness was used starting with the 2012 NSDUH. All mental illness estimates presented in detailed or mental health detailed tables from the 2008 NSDUH and onward have been updated; thus, these estimates are based on the revised model. Additional details about the creation and use of these variables are provided in the Recoded Mental Health Appendix.

The following variable, WSPDSC2, is an alternative version of the original worst K6 total score in the past year (K6SCMAX) with values ranging from 0 to 17 rather than 0 to 24. The original total score variable is documented previously in this section with the psychological distress variables. This alternative total score was calculated by assigning a value of 0 when K6SCMAX had a value from 0 to 7 and assigning a value of 1 to 17 when K6SCMAX had a corresponding value from 8 to 24. This alternative version was used in the regression model to determine SMI because SMI prevalence was typically extremely low for respondents with worst K6 total scores less than 8. Specific details about this variable are provided in the Recoded Mental Health Appendix.

<u>(K6SCMAX)</u>		<u>WSPDSC2</u>	Len : 2	RC-ALTERNATIVE WORST K6 TOTAL SCORE	<b>Freq</b>	<b>Pct</b>
RANGE = 0 - 17 .....					27170	82.60
. = Aged 12-17 (AGE2<7) .....					5723	17.40

## RECODED MENTAL HEALTH

NOTE: The following two variables, WHODASC2 and WHODASC3, are score variables that indicate the level of impairment for respondents. These variables are based on data collected from a series of thirteen questions asking respondents how much difficulty they experienced in doing eight daily activities in the one month in the past year when they were at their worst emotionally. These questions, drawn from the World Health Organization Disability Assessment Schedule (WHODAS), comprise an abbreviated scale which is used to capture information on impairment (see the Recoded Mental Health Appendix for more information). Respondents who had indicated during the administration of any of the K6 items that they had experienced at least one of the K6 symptoms (defined in the note above variables K6SCMON and K6SCYR) at least "a little of the time" (i.e., K6SCMON greater than 0 or K6SCYR greater than 0) were asked about remembering to do things they needed to do (IMPREMEM), concentrating on doing something important when other things were going on around them (IMPCONCN), going out of the house and getting around on their own (IMPGOUT, IMPGOUTM), dealing with people they did not know well (IMPPEOP, IMPPEOPM), participating in social activities (IMPSOC, IMPSOCM), taking care of household responsibilities (IMPHHLD, IMPHLDLM), taking care of daily responsibilities at work or school (IMPRESP, IMPRESPM), and getting daily work done as quickly as needed (IMPWORK, IMPRESPM). Respondents who reported that they did not engage in an activity were asked a follow-up question to determine if they did not do so because of emotions, nerves, or mental health.

For the original WHODAS total score, WHODASC2, a value of 3 was assigned for each of the daily activities that a respondent indicated having "severe" difficulty performing, or if the respondent indicated not performing the activity due to problems with emotions, nerves, or mental health. A value of 2 was assigned for each of the daily activities that a respondent indicated having "moderate" difficulty performing, and a value of 1 was assigned for "mild" difficulty. For activities that had a follow-up question, a response of "yes" were assigned a value of a 3 as having "severe" difficulty." A value of 0 was assigned for all other responses and nonresponses for each activity. These assigned values were summed to calculate a total score for WHODASC2 which ranges from 0 to 24.

For the alternative WHODAS total score, WHODASC3, a value of 1 was assigned for each of the daily activities that a respondent indicated having "moderate" or "severe" difficulty performing, or if the respondent indicated not performing the activity due to problems with emotions, nerves, or mental health. For activities that had a follow-up question, a response of "yes" were assigned a value of a 1 as having "moderate or severe" difficulty." A value of 0 was assigned for all other responses and nonresponses for each activity. These assigned values were summed to calculate a total score for WHODASC3 which ranges from 0 to 8. The alternative version of the WHODAS total score (WHODASC3) was used in the regression model to determine SMI, since it was thought that the sum of a dichotomous measure might fit better than the sum of a linear continuous measure.

Specific details about these variables are provided in the Recoded Mental Health Appendix.

NOTE: The following 14 mental illness variables are based on the 2012 mental illness prediction model. These variables are not comparable with similarly named variables (based on the 2008 mental illness prediction model) in previous NSDUHs; thus, these variables were renamed by appending "\_U" to the previous variable names. Starting with the 2014 NSDUH, new mental illness variable names end only with a "U" and there are no existing similarly named 2008 model based variables. Recommendations concerning the analysis of the mental illness variables derived from the predicted probability of SMI (SMIPP\_U) are noted in the documentation above SMIYR\_U. Variables based on the 2008 mental illness prediction model are not being provided for the 2012 and future NSDUHs. All the 2008 model-based mental illness variables typically found in this section have been removed from the 2008-2011 NSDUH data files and replaced with the revised 2012 model based mental illness variables. The only exception is SMIPP (the SMI predicted probability based on the 2008 model) which remains available on the 2008-2011 NSDUH data files. Specific details about these variables and the prediction models are provided in the Recoded Mental Health Appendix. In order to be able to make comparisons of SMI estimates across years, SMI variables were created for 2005-2007 based on an alternative model. The 2005-2007 SMI recodes, SMIPP\_A and SMIYR\_A, are considered comparable with the variables SMIPP\_U and SMIYR\_U, respectively, for 2008 and later NSDUHs. However, users should consider the differences in methodology before making any decisions on whether and how to use the 2005-2007 SMI variables. Specific details about these 2005-2007 variables are provided in the Recoded Mental Health Appendix. The following variable, SMIPP\_U, is a predicted probability that a respondent has Serious Mental Illness (SMI) estimated using the 2012 revised logistic regression model. SMIPP\_U was used to determine these levels of mental illness: Serious (SMI), Serious or Moderate (SMMI), and Any (AMI). The categories of Moderate (MMI) and Mild (LMI) were determined by subtraction.

(AMDEY2\_U, MHSUTK\_U, WHODASC3, WSPDSC2)

SMIPP\_U      Len : 12    RC-PREDICTED SERIOUS MENTAL ILLNESS PROB REVISED

## RECODED MENTAL HEALTH

NOTE: The following six variables (SMIYR\_U, AMIYR\_U, SMMIYR\_U, MMIYR\_U, LMIYR\_U, and LMMIYRU) are not recommended to be used when analyzing variables for past year suicidal thoughts, past year MDE, K6, or the WHODAS, nor are they recommended to be used when analyzing other variables closely linked with these variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, lifetime MDE, SPD, or components used in the K6 or WHODAS scales). Specific details about the creation and use of these variables can be found in the Recoded Mental Health Appendix.

In order to be able to make comparisons of SMI estimates across years, SMI variables were created for 2005-2007 based on an alternative model. The 2005-2007 SMI recodes, SMIPP\_A and SMIYR\_A, are considered comparable with the variables SMIPP\_U and SMIYR\_U, respectively, for 2008 and later NSDUHs. However, users should consider the differences in methodology before making any decisions on whether and how to use the 2005-2007 SMI variables. The same analysis recommendation noted above also applies for the 2005-2007 SMIYR\_A variable. Specific details about these 2005-2007 variables are provided in the Recoded Mental Health Appendix.

The following variable, SMIYR\_U, is a Serious Mental Illness (SMI) indicator for respondents based on the 2012 revised predicted probability of SMI (SMIPP\_U). If SMIPP\_U is greater than or equal to a specified cutoff point (0.260573529) then SMIYR\_U=1, and if SMIPP\_U is less than the cutoff point then SMIYR\_U=0. This indicator is not comparable with SMI variables prior to 2008, in which SMI was only based on psychological distress. Also, this indicator based on the 2012 model is not comparable with the indicator based on the 2008 model. Specific details about this variable can be found in the Recoded Mental Health Appendix.

<u>(SMIPP_U)</u>	<u>SMIYR_U</u>	Len : 1 RC-SMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB	<b>Freq</b>	<b>Pct</b>
	.	= Aged 12-17 (AGE2<7) .....	5723	17.40
	0	= No Past Year SMI (See comment above).....	25250	76.76
	1	= Past Year SMI (See comment above) .....	1920	5.84

The following variable, AMIYR\_U, is an indicator for Any Mental Illness (AMI) based on the 2012 revised predicted probability of SMI (SMIPP\_U). If SMIPP\_U is greater than or equal to a specified cutoff point (0.0192519810) then AMIYR\_U=1, and if SMIPP\_U is less than the cutoff point then AMIYR\_U=0. This indicator based on the 2012 model is not comparable with the indicator based on the 2008 model. AMI is defined as having Serious, Moderate, or Mild Mental Illness. Specific details about this variable can be found in the Recoded Mental Health Appendix.

<u>(SMIPP_U)</u>	<u>AMIYR_U</u>	Len : 1 RC-AMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB	<b>Freq</b>	<b>Pct</b>
	.	= Aged 12-17 (AGE2<7) .....	5723	17.40

	1	= Past Year Any Mental Illness (See comment above) .....	6967	21.18

The following variable, SMMIYR\_U, is an indicator for Serious or Moderate Mental Illness (SMMI) based on the 2012 revised predicted probability of SMI (SMIPP\_U). If SMIPP\_U is greater than or equal to a specified cutoff point (0.077686285365) then SMMIYR\_U=1, and if SMIPP\_U is less than the cutoff point then SMMIYR\_U=0. This indicator based on the 2012 model is not comparable with the indicator based on the 2008 model. Specific details about this variable can be found in the Recoded Mental Health Appendix.

<u>(SMIPP_U)</u>	<u>SMMIYR_U</u>	Len : 1 RC-SMMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB	<b>Freq</b>	<b>Pct</b>
	.	= Aged 12-17 (AGE2<7) .....	5723	17.40
	0	= No Past Year SMMI (See comment above).....	23431	71.23
	1	= Past Year SMMI (See comment above) .....	3739	11.37

The following variable, MMIYR\_U, is an indicator for Moderate Mental Illness (MMI). This indicator derived from mental illness variables based on the 2012 model is not comparable with the indicator derived from mental illness variables based on the 2008 model. Specific details about this variable can be found in the Recoded Mental Health Appendix.

<u>(SMIYR_U, SMMIYR_U)</u>	<u>MMIYR_U</u>	Len : 1 RC-MOD MI IND (1/0) BASED ON REVISED PRED SMI PROB	<b>Freq</b>	<b>Pct</b>

2 = Past Year Moderate Mental Illness (MMIIYR_U=1).....	1819	5.53
3 = Past Year Serious Mental Illness (SMIYR_U=1).....	1920	5.84

NOTE: The following six variables are recodes that combine mental illness measures based on the 2012 revised predicted probability of SMI (SMIPP\_U) with substance use disorder (SUD) in the past year. SMISUDPY, AMISUDPY, and LMMISUDPY were created using the DSM-IV based SUD variables. Whereas SMISUD5YR, AMISUD5YR, and LMMISUD5YR were created using the DSM-5 based SUD variables. Recodes based on DSM-5 use disorder criteria were used starting in the 2020 Detailed Tables. These DSM-IV variables based on the 2012 mental illness prediction model are not comparable with similarly named variables from previous years due to the change in the model as well as changes in the dependence or abuse variables starting with the 2015 NSDUH. The DSM-5 variables are also not comparable to similarly named variables from previous years due to the change in mental illness model as well as the change to DSM-5 criteria for the use disorder variables. Please note that SMISUDPY, AMISUDPY, LMMISUDPY, SMISUD5YR, AMISUD5YR, and LMMISUD5YR are not recommended to be used when analyzing variables for past year suicidal thoughts, past year MDE, K6, or the WHODAS, nor are they recommended to be used when analyzing other variables closely linked with these variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, lifetime MDE, SPD, or components used in the K6 or WHODAS scales). Specific details about the creation and use of the mental illness variables used in these recodes can be found in the Recoded Mental Health Appendix. Specific information about the SUD variables used in these recodes can be found in the Nicotine Dependence and Substance Use Disorder Appendix.

## RECODED ADULT DEPRESSION

### RECODED ADULT DEPRESSION

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: The following variable, AMDELT, identifies an adult as having a major depressive episode (MDE) in their lifetime and AMDEYR identifies an adult as having MDE in the prior year. Due to questionnaire changes in 2008, these MDE variables are not directly comparable to MDE variables from 2004 to 2008. Adjusted lifetime and past year MDE variables (AJAMDELT and AJAMDEYR) were developed to allow comparisons of adult MDE data across years beginning with 2005 and continuing through 2008 and later years. Adjusted variables were not created for 2004. The youth MDE variables continue to remain comparable between 2004 and future years. Specific details about the analysis of MDE data can be found in the Recoded Depression Variable Documentation Appendix.

A respondent was classified as having a major depressive episode (MDE) in their lifetime, AMDELT=1, if they reported experiencing at least five out of the nine criteria used to define an adult as having had MDE in their lifetime, where at least one of the criteria is a depressed mood or loss of interest or pleasure in daily activities (ADSMMDA=1).

An adult was classified as NOT having a major depressive episode (MDE) in their lifetime, AMDELT=2, if they met either of these conditions:

1. Reported experiencing fewer than five out of the nine criteria used to define an adult as having had MDE in their lifetime (ADSMMDA=2).
2. If the number of criteria used to define an adult as having had MDE in their lifetime is unknown (ADSMMDA=98) and the respondent reported at least one of the following:
  1. Never having had a period of time lasting several days or longer when felt sad, empty, or depressed (ADPPREV=2), discouraged about how things were going in life (ADDSCEV=2), and lost interest in most things usually enjoyable (ADLOSEV=2).
  2. Experienced the feelings in (i), but they did not last most of the day, nearly every day for two weeks or longer (ADLSI2WK=2) or (ADDPREV2WK=2).
  3. Experienced the feelings in (i) most of the day, nearly every day for two weeks or longer, but the feelings lasted less than an hour when mood was most severe and frequent (ADWRHRS=1).
  4. Experienced the feelings in (i) most of the day, nearly every day for two weeks or longer for at least an hour during those times when mood was most severe and frequent, but emotional distress was mild (ADWRDST=1), there was never a time when emotional distress was so severe that you could not be cheered up (ADWRCHR=4), and there was never a time when your emotional distress was so severe that you could not carry out your daily activities (ADWRIMP=4).
  5. Experienced the feelings in (i) most of the day, nearly every day for two weeks or longer for at least an hour and the severe distress were more than mild or at some point could not be cheered up or could not carry out daily activities, but never had any other problems during those weeks, such as changes in sleep, appetite, energy, the ability to concentrate and remember, or feelings of low self-worth (ADPPROB=2).

## RECODED ADULT DEPRESSION

NOTE: The following 21 variables are among all adult respondents who were asked the respective questions and are not confined to those respondents who were ultimately classified as having a Major Depressive Episode (MDE) in their lifetime or past year. To produce estimates among adults with MDE, the analysis will need to be restricted by either the lifetime MDE variable (AMDELT) or the past year MDE variable (AMDEYR).

The following variable, AOTHMDE, defines an adult as having seen or talked to another professional about MDE during the past year if s/he entered a valid write-in response other than the responses that matched existing categories.

An adult was classified as NOT having seen or talked to another professional about MDE during the past year, AOTHMDE=0, if s/he met either of these conditions:

1. Reported NOT seeing or talking to a medical doctor or other professional during the past year (ADSEEDOC=2).
2. Response not entered for whether other mental health professional was seen or talked to during the past year (ADOTHHLP=6).
3. Write-in response entered matched an existing category.

## RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION

### **RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION**

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: The following recoded variables contain information about whether youths received mental health care in the past year from each of 11 specific services for problems with behaviors or emotions that were not caused by alcohol or drugs.

#### RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION

The following variable, ANYNSMH, indicates whether a youth reported receiving nonspecialty mental health services in the past year from any of five specific nonspecialty sources for problems with behavior or emotions that were not caused by alcohol or drugs. This variable was created based on the following five source of treatment variables: school social worker, school psychologist, or school counselor (YSHSW), special school or program within a regular school for students with emotional or behavioral problems (YSPEC), pediatrician or other family doctor (YPED), juvenile detention center, prison, or jail (YJAIL), and foster care or therapeutic foster care (YFOST). Youths who reported a positive response (source variable=1) to one or more of the five questions were included in the yes category regardless of how many of the five questions they answered. Youths who did not report a positive response, but answered all five of the questions were included in the no category. Youths who did not report a positive response and did not answer all the questions, and adults were included in the unknown/18+ category.

0 = No (All source variables=0).....	4618	14.04
1 = Yes (Any source variable=1) .....	961	2.92

The following variable, ANYMHED2, indicates whether a youth enrolled in school reported receiving mental health services in the past year from education sources for problems with behavior or emotions that were not caused by alcohol or drugs. This variable was created using the following source of treatment variables: talked to school social worker, school psychologists, or school counselors for problems (YSHSW) and attended a special school or participated in a special program at a regular school for problems (YSPEC). Youths who reported a positive response (source variable=1) to one or more of these questions were included in the yes category regardless of how many of the questions they answered. Youths who did not report a positive response, but answered both questions were included in the no category. Youths who did not report a positive response and did not answer both questions, and adults were included in the unknown/18+ category. Due to questionnaire changes in the Youth Mental Health Utilization module in the 2009 NSDUH, this variable is not comparable to variables prior to the 2009 which were named similarly.

The following variable, ANYSEDMF, indicates whether a youth reported receiving specialty mental health services along with services from education, general medicine (family doctor/pediatrician), or foster care or therapeutic foster care settings in the past year for problems with behavior or emotions that were not caused by alcohol or drugs. This variable was created using the following four source of treatment variables: received specialty mental health services (ANYSMH2), education setting-based mental health services (ANYMHED2), treatment from a family doctor/pediatrician (YPED), and foster care or therapeutic foster care (YFOST). Included in the unknown/18+ category were youths who did not provide enough information to determine whether mental health care was received at both a specialty mental health service along with services from either an education, general medical, or foster care setting [ANYSMH2=. or {ANYSMH2=1 and (none of ANYMHED2, YPED, or YFOST equal 1 but at least one is missing)}] and adults.

#### RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION

The following variable, SPINVST2, indicates how many overnight stays were reported at an inpatient/residential specialty mental health service in the past year. The number of overnight stays is calculated by adding the number of overnight stays at a hospital (YUHOSPN2) and residential treatment center (YURSIDN2). A value of 6 (No Overnight Stays) was assigned whenever a respondent said they had used none of the services (YUHOSPYR=2 and YURSIDYR=2). A value of missing was assigned when the response to whether received treatment or number of overnight stays was unknown for either of the locations (YUHOSPYR or YURSIDYR=85, 94, 97, 98 OR either of YUHOSPN2 or YURSIDN2=985, 994, 997, 998), unless the overnight stays for the service with non-missing information was greater than or equal to 25, in which case a value of 5 (25 or more stays) was assigned. A missing value was also assigned for respondents aged 18 or older.

The following variable, SPOUTVST, indicates how many times a specialty outpatient mental health service was visited in the past year. The number of visits is calculated by adding the number of visits to a day treatment facility (YUDYTXN2), mental health clinic (YUMHCRN2), private therapist (YUTPSTN2), and an in-home therapist (YUIHTPN2). A value of 6 (No Visits) was assigned whenever a respondent said they had used none of the services (YUDYTXYR, YUMHCRYR, YUTPSTYR, YUIHTPYR all equal 2). A value of missing was assigned when the response to whether received treatment or number of visits was unknown for any of the 4 locations (any of YUDYTXYR, YUMHCRYR, YUTPSTYR, YUIHTPYR=85, 94, 97, 98 OR any of YUDYTXN2, YUMHCRN2, YUTPSTN2, YUIHTPN2=985, 994, 997, 998), unless the sum of the visits for services with non-missing information was greater than or equal to 25, in which case a value of 5 (25 or more visits) was assigned. A missing value was also assigned for respondents aged 18 or older.

## RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION

NOTE: The following 13 variables contain the reasons youths received their most recent mental health services from at least one inpatient specialty mental health source for emotional or behavioral problems not caused by alcohol or drugs. These variables are not comparable to similarly named variables found in NSDUH datafiles prior to 2012 due to the relocation of foster care into the nonspecialty treatment category instead of the specialty treatment category where it previously was included. During the 2017 NSDUH, updates were made to classify certain patterns of responses as 'Reason Not Indicated' rather than 'No Trt/Unknwn Reason/Aged 18+'. Due to the small impact on the estimates, these 13 variables are still considered comparable to prior years and were not renamed. Starting with the 2017 Detailed Tables, the reasons youths received their most recent mental health services from at least one inpatient/residential specialty mental health source estimates in 2016 and later years are based on these updated versions. As a result, the 2016 estimates presented in the 2017 Detailed Tables may differ from previously published estimates.

The following variable, SIMHSUI2, indicates whether a respondent received their most recent mental health services from at least one inpatient specialty mental health source in the past year because they thought about or tried to kill themselves. This recode was created by examination of the following source variables: stayed overnight in hospital (YUHOSUIC) or residential treatment center (YURSSUIC) because of suicidal thoughts. None of the write-in other-specify values were applicable for this variable. Adults, youths that did not report receiving services from either of these inpatient/residential sources in the past year, and youths that reported receiving services in the past year, but did not indicate a valid reason for receiving services at any of these locations were assigned to the unknown category.

NOTE: The following 13 variables contain the reasons youths received their most recent mental health services from at least one specialty mental health source for emotional or behavioral problems not caused by alcohol or drugs. These variables are not comparable to similarly named variables found in NSDUH datafiles prior to 2012 due to the relocation of foster care into the nonspecialty treatment category instead of the specialty treatment category where it previously was included. During the 2017 NSDUH, updates were made to classify certain patterns of responses as 'Reason Not Indicated' rather than 'No Trt/Unknwn Reason/Aged 18+'. Due to the small impact on the estimates, these variables are still considered comparable to prior years and were not renamed. Starting with the 2017 Detailed Tables, the reasons youths received their most recent mental health services from at least one specialty mental health source estimates in 2016 and later years are based on these updated versions. As a result, the 2016 estimates presented in the 2017 Detailed Tables may differ from previously published estimates.

The following variable, SMHSU12, indicates whether a respondent received their most recent mental health services from at least one specialty mental health source in the past year because they thought about or tried to kill themselves. This recode was created by examination of the following source variables: stayed overnight in hospital (YUHOSUIC), residential treatment center (YURSSUIC), or visited a day treatment program (YUDYSUIC), mental health center (YUMHSUIC), private therapist (YUTPSUIC), or received treatment from an in-home therapist (YUIHSUIC) because of suicidal thoughts. None of the write-in other-specify values were applicable for this variable. Adults, youths that did not report receiving services from any of the 6 specialty sources in the past year, and youths that reported receiving services in the past year, but did not indicate a valid reason for receiving services at any of these locations were assigned to the unknown category.

## RECODED YOUTH MENTAL HEALTH SERVICE UTILIZATION

The following variable, SMHSCHL2, indicates whether a respondent received their most recent mental health services from at least one specialty mental health source in the past year because they had problems at school. This recode was created by examination of the following source variables: stayed overnight in hospital (YUHOSCHL), residential treatment center (YURSSCHL), or visited a day treatment program (YUDYSCHL), mental health center (YUMHSCHL), private therapist (YUTPSCHL), or received treatment from an in-home therapist (YUIHSCHL) because they had problems at school. None of the write-in other-specify values were applicable for this variable. Adults, youths that did not report receiving services from any of the 6 specialty sources in the past year, and youths that reported receiving services in the past year, but did not indicate a valid reason for receiving services at any of these locations were assigned to the unknown category.

1 = Reason Indicated (Any source variable=1,3) .....	166	0.50

The following variable, SMHMEND2, indicates whether a respondent received their most recent mental health services from at least one specialty mental health source in the past year because they had a diagnosed mental disorder. This recode was created based only on responses to other-specify write-in variables: most important reason for staying overnight in a hospital, residential treatment center, or visited a day treatment program, mental health center, private therapist, or received treatment from an in-home therapist was because they had a diagnosed mental disorder. A respondent was classified as having indicated that they received mental health services for this reason if any of the above other-specify variables indicated reasons related to mental disorders. Adults, youths that did not report receiving services from any of the 6 specialty sources in the past year, and youths that reported receiving services in the past year, but did not indicate a valid reason for receiving services at any of these locations were assigned to the unknown category.

NOTE: The following 13 variables contain the reasons youths last talked with their school social worker, school psychologist, or school counselor in the past year. These variables are not comparable with variables named SHCNXXX in NSDUHs prior to 2009 due to questionnaire changes in the Youth Mental Health Utilization module. During the 2017 NSDUH, updates were made to classify certain patterns of responses as 'Reason Not Indicated' rather than 'No Trt/Unknwn Reason/Aged 18+'. Due to the small impact on the estimates, these variables are still considered comparable to prior years and were not renamed. Starting with the 2017 Detailed Tables, the reasons youths last talked with their school social worker, school psychologist, or school counselor in the past year estimates in 2016 and later years are based on these updated versions. As a result, the 2016 estimates presented in the 2017 Detailed Tables may differ from previously published estimates.

The following variables, SHSWXXX, indicate whether a respondent last talked with their school social worker, school psychologist, or school counselor in the past year because of respective reasons. Youths were assigned a "Reason not indicated" for the specific reason if they did not indicate that specific reason for their last talk with their school social worker, school psychologist, or school counselor (YUSWSUIC=6) but did indicate one of the other 12 reasons. Adults, youths that did not report or had unknown information about receiving services from a school social worker, school psychologist, or school counselor in the past year, and youths that reported receiving services in the past year, but did not indicate any valid reason for receiving services were assigned to the unknown category.

NOTE: The following four variables were created by using a combination of variables from the following sections: Recoded Youth Mental Health Service Utilization and Recoded Drug Treatment. Specifications on how the individual Recoded Youth Mental Health Service Utilization variables were defined can be found above. Specifications on how the individual Recoded Drug Treatment variable was defined can be found in the Recoded Drug Treatment section.

The following four variables were created based on three source variables: received specialty mental health services in the past year (ANYSMH2), received non-specialty mental health services in the past year (ANYNSMH), and received substance use treatment at a specialty facility in the past year (TXYRSPILAL).

The following variable, YMHOSPTX, indicates whether a youth reported receiving mental health services in the past year or substance use treatment at a specialty facility in the past year. A respondent was assigned a positive response if they were 12 to 17 years old and received specialty/non-specialty mental health services, or received substance use treatment at a specialty facility in the past year (AGE2=1-6 and ((ANYSMH2=1 or ANYNSMH=1) or TXYRSPILAL=1)). A respondent was assigned a negative response if they were 12 to 17 years old and did not receive specialty or non-specialty mental health services, and did not receive substance use treatment at a specialty facility in the past year (AGE2=1-6 and (ANYSMH2=0 and ANYNSMH=0) and TXYRSPILAL=0).

## RECODED ADOLESCENT DEPRESSION

### **RECODED ADOLESCENT DEPRESSION**

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: Starting with the 2004 NSDUH, respondents were administered separate age-appropriate depression modules designed to measure whether or not respondents had experienced a major depressive episode (MDE) in their lifetime and past year. All adolescent (youth) respondents aged 12 to 17 were asked questions from the Youth Depression module. The 2004 NSDUH only asked a subsample of adults aged 18 or older the questions from the Adult Depression module, but starting in 2005, all adults were administered the questionnaire module.

From 2004 through 2007, a single set of variables was created containing the recoded MDE data for both adult and adolescent respondents combined. In 2008, instead of a single set of variables, two recoded sets of MDE variables were created for adolescents and adults separately. This change was due to the presence of context effects in the adult estimates stemming from changes in the mental health module which precedes the adult depression section within the questionnaire. Based on an analysis of the 2008 data that evaluated the presence of context effects, it was determined that the adult depression estimates in 2008 and later years are not comparable with years prior to 2008, and the variables were therefore renamed to indicate the lack of comparability. The youth depression estimates were not impacted by the 2008 adult questionnaire changes and are considered comparable across years. Therefore, only the youth depression variables that were previously defined for both adults and youth had to be renamed. Multi-year trend analyses can be performed by renaming the recoded adolescent depression variables the same across years. Youth depression variables that did not require renaming are noted specifically in the comments above the variables below. See the 2008 Recoded Mental Health Appendix for more detailed information on the 2008 changes as well as the 2008 Recoded Depression Variable Documentation Appendix for example SAS code showing how to rename the variables for multi-year analyses.

In 2009, changes were made to the youth mental health service utilization (YMHSU) questions that preceded the adolescent depression questions. These changes included the replacement of five questions that asked about receipt of special education services and school counseling, and time spent in jail or foster care with questions that asked about receipt of mental health services in the education and justice system sectors. Due to this change, a context effect analysis was done using data from the first 6 months of the 2009 NSDUH and sought to determine whether changes in the YMHSU module affected responses to the first three adolescent depression questions and the lifetime and past year MDE estimates. The results of the analysis showed these changes in 2009 did not appear to affect the estimates of adolescent MDE; therefore, no further variable changes were needed.

Additional details on these adolescent depression recoded variables are provided in the Recoded Depression Variable Documentation Appendix.

The following variable, YMDELT, classifies an adolescent as having a major depressive episode (MDE) in their lifetime, YMDELT=1, if they reported experiencing at least 5 out of the 9 criteria used to define an adolescent as having had MDE in their lifetime, where at least one of the criteria is a depressed mood or loss of interest or pleasure in daily activities (YODSMMDE=1).

An adolescent was classified as NOT having a major depressive episode (MDE) in their lifetime, YMDELT=2, if they met either of these conditions

- Reported experiencing fewer than five out of the nine criteria used to define an adolescent as having had MDE in their lifetime (YODSMMDE=2).
- If the number of criteria used to define an adolescent as having had MDE in their lifetime is unknown (YODSMMDE=94, 97, 98) and the respondent reported at least one of the following.
  - Never having had a period of time lasting several days or longer when felt sad, empty, or depressed (YODPREV=2), discouraged or hopeless about how things were going in life (YODSCEV=2), and lost interest and became bored with most things usually enjoyable (YOLOSEV=2).
  - Experienced the feelings in (i), but they did not last most of the day, almost every day for two weeks or longer [YOLSI2WK=2 or YODPR2WK=2].
  - Experienced the feelings in (i) most of the day, almost every day for two weeks or longer, but the feelings lasted less than an hour when mood was most severe and frequent (YOWRhrs=1).
  - Experienced the feelings in (i) most of the day, almost every day for two weeks or longer for at least an hour during those times when mood was most severe and frequent, but the bad feelings were mild (YOWRDST=1), there was never a time when you felt so bad that nothing could cheer you up (YOWRCHR=4), and there was never a time when you felt so bad that you could not carry out your daily activities (YOWRIMP=4).
  - Experienced the feelings in (i) most of the day, almost every day for two weeks or longer for at least an hour with bad feelings that were more than mild or at some point could not be cheered up or could not carry out daily activities, but never had any other problems during those weeks, such as changes in sleep, eating, energy, the ability to keep mind on things, or feeling badly about self (YODPPROB=2).

(YODPPROB, YODPR2WK, YODPREV, YODSCEV, YODSMMDE, YOLOSEV, YOLSI2WK, YOWRCHR, YOWRDST, YOWRhrs, YOWRIMP)

The following variable, YOTHMDE, defines an adolescent as having seen or talked to another professional about MDE during the past year, YOTHMDE=1, if s/he entered a valid write-in response other than the responses that matched the existing categories.

An adolescent was classified as NOT having seen or talked to another professional about MDE during the past year, YOTHMDE=0, if s/he met either of these conditions:

1. Reported NOT seeing or talking to a medical doctor or other professional during the past year (YOSEEDOC=2).
2. Response not entered for whether other mental health professional was seen or talked to during the past year (YOOTHHLP=6).
3. Write-in response entered matched an existing category.

## RECODED ADOLESCENT DEPRESSION

The following variable, YHLMDE, indicates whether a youth reported seeing or talking to a health professional about MDE in the past year. Youths were classified as having seen or talked to a health professional, YHLMDE=1, if they reported seeing or talking to any of the following professionals: general practitioner or family doctor (YDOCMD=1); other medical doctor (YOMDMDE=1); psychologist (YPSY1MDE=1); psychiatrist or psychotherapist (YPSY2MDE=1); social worker (YSOCMDE=1); counselor (YCOUNMDE=1); other mental health professional (YOMHMDE=1); or nurse, occupational therapist, or other health professional (YNURSMDE=1). Respondents were classified as having not seen or talked to a health professional, YHLMDE=0, if they reported not seeing or talking to all of the professionals listed above (source variable=0).

#### RECODED ADOLESCENT DEPRESSION

NOTE: The following five variables were not renamed in 2008 since they were originally only defined for youth; therefore, no changes are needed for these in order to generate analyses across years.

NOTE: The following four variables make up the four role domains (chores at home, school or work, close relationships with family, and social life) of the Sheehan Disability Scale (SDS), which measures the impact of a disorder on an adolescent's life.

<i>(YOPSHMGT)</i>	<i>Len : 1 RC-YOUTH: MDE ROLE IMPAIRMENT - CHORES AT HOME</i>	<b>Freq</b>	<b>Pct</b>

## CONSUMPTION OF ALCOHOL

### **CONSUMPTION OF ALCOHOL**

*The values in this section may be inconsistent with values for variables in other sections of the interview. Items in this section were edited when respondents legitimately skipped out of these items based on prior answers in earlier sections. Otherwise, variables in one section of the interview generally were not edited to make them consistent with variables in another section of the interview. This note applies to variables in this section marked by a<sup>1</sup>.*

NOTE: Beginning in 2017, respondents who reported that they used alcohol on 0 days in the past 30 days are no longer asked questions in the consumption of alcohol module that pertain to the past 30 days. This change has resulted in an increase in the number of respondents who were coded as "blank" compared with data from 2016 and prior years. However, this change was determined not to have affected the comparability of estimates since 2017 with those prior to 2017.

Next we return to the topic of alcohol. Remember that by a "drink", we mean a can or bottle of beer, a glass of wine or a wine cooler, a shot of liquor, or a mixed drink with liquor in it. We are not asking about times when you only had a sip or two from a drink.

Earlier, the computer recorded that you drank at least one alcoholic beverage within the past 30 days, that is, since [DATEFILL].

Please think about the last time you drank any alcoholic beverage. How many drinks did you have that time?

*(CA01)*

NOTE: Beginning in 2015, female respondents were asked for CABINGEV, CABINGAGE, CABINGYFU, and CABINGMFU to report about consumption of 4 or more drinks on the same occasion. As in prior years, male respondents in 2015 were asked for CABINGEV, CABINGAGE, CABINGYFU, and CABINGMFU to report about consumption of 5 or more drinks on the same occasion. Variables pertaining to consumption of 5 or more drinks or 4 or more drinks on the same occasion have been edited with respect to ALCUS30D and ALCBNG30D.

CABINGFLG takes into account the editing of the variables ALCUS30D and ALCBNG30D in the ALCOHOL module.

## RECODED CONSUMPTION OF ALCOHOL

### **RECODED CONSUMPTION OF ALCOHOL**

NOTE: The variables in this section are recoded variables that were created from one or more of the edited variables from the preceding section.

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

The following variable defines the social context of a respondent's last alcohol use, including whether they drank alone or if they were with one or more persons.

<b>(CADRPEOP)</b> <u>UADPEOP</u>	Len : 1 RC-SOCIAL CONTEXT OF MOST RECENT ALCOHOL USE	<b>Freq</b> <b>Pct</b>

NOTE: Starting with the 2020 NSDUH, the following variables MMBJOINT, MMBLOOSE, and MMBOTHER replace variable MMJNTLOO that was created for the 2002 through 2014 and 2018 through 2019 NSDUHs. Beginning with the 2020 survey, the format of MJE06 was revised so respondents could select all answer choices that apply to them including a new response option, resulting in a new edited variable created for each response option. Therefore, these variables are not considered comparable to the variable created in 2019 and earlier years.

Think about the last time you bought marijuana. Did you buy marijuana that had already been rolled into joints, marijuana that was in loose form, or marijuana that was in some other form?

## MARKET INFORMATION FOR MARIJUANA

NOTE: Starting with the 2020 NSDUH, the following variables MMBUYWHO1, MMBPLACE1, MMBPLOSP2, and MMBATJOB1 replace variables MMBUYWHO, MMBPLACE, MMBPLOSP, and MMBATJOB that were created for the 2002 through 2014 and 2018 through 2019 NSDUHs. Beginning with the 2020 survey, a criterion was added to the skip logic governing the administration of questions MJE26, MJE27, and MJE28 causing respondents who reported buying their last marijuana from a store or dispensary (MJE05b=1) to be skipped out of these questions. In addition, respondents are routed to MJE27SP based on the response to MJE27. Therefore, these variables are not considered comparable to variables created in 2019 and earlier years.

The last time you bought marijuana, who did you buy it from?

*(MJE26)*

## MARKET INFORMATION FOR MARIJUANA

NOTE: Starting with the 2020 NSDUH, the following variables MMTJOINT, MMTLOOSE, and MMTOTHER replace variable MMTJNTLS that was created for the 2002 through 2014 and 2018 through 2019 NSDUHs. Beginning with the 2020 survey, the format of MJE36 was revised so respondents could select all answer choices that apply to them including a new response option, resulting in a new edited variable created for each response option. Therefore, these variables are not considered comparable to the variable created in 2019 and earlier years.

Think about the last time you traded something for marijuana. Did you get marijuana that had already been rolled into joints, marijuana that was in loose form, or marijuana in some other form?

*(MJE361)*

## DEMOGRAPHICS

### DEMOCRAPHICS

### DEMOCRAPHICS

NOTE: After a respondent has entered his/her birthdate in the first part of the questionnaire, he/she has multiple opportunities to change his/her age in response to consistency checks throughout the questionnaire. It is therefore possible for the age recorded by the respondent at the beginning of the questionnaire to be different than the age at the end of the questionnaire. The final age variable is determined using these two constituent age variables, in addition to the age calculated from the raw birthdate and the final edited interview date, the age entered in the questionnaire roster (if it exists), and the pre-interview screener age.

<u>AGE2</u>	Len : 2 RECODE - FINAL EDITED AGE	<b>Freq</b>	<b>Pct</b>

IMPUTED DEMOGRAPHICS

**IMPUTED DEMOGRAPHICS**

Beginning with the 2002 survey, missing values for the gender question (QD01) were no longer permitted. Thus, no imputation was required. This variable has the prefix 'IR', which stands for 'Imputation Revised', only for the sake of consistency with data sets from earlier surveys.

<i>(QD01)</i>	Len : 1 IMPUTATION REVISED GENDER	<b>Freq</b>	<b>Pct</b>
<u>IRSEX</u>	1 = Male.....	15130	46.00
	2 = Female .....	17763	54.00

NOTE: The variable IRMARIT reflects the move of the marital status questions from self-administration in 2015 back to interviewer administration in 2016. This variable is considered to be comparable with corresponding variables in 2002 to 2014 (when this question also was interviewer-administered) but is not considered to be comparable with the marital status variable IRMARITSTAT in 2015. Analytic goals should be considered prior to pooling or comparing marital status data from 2015 with data from other years.

## EDUCATION

EDUCATION

NOTE: EDUSCHLGO takes into account information from follow-up probes if respondents originally reported that they were not enrolled in school. Based on these probes, respondents were coded as yes (i.e., enrolled) if they were on break from school and intended to return to school once their break was over. EDUSCHLGO was assigned a code of 11 if the respondent reported currently being enrolled but there was uncertainty about the respondent's school enrollment status.

The next questions are about school. By 'school', we mean elementary school, junior high or middle school, high school, or a college or university. Please include home schooling as well. Do you go to school?

If you are on a holiday or break from school, such as spring break or summer vacation, but plan to return when the break is over, please answer yes.

(QD17, QD17A, QD17B)

## RECODED EDUCATION

RECODED EDUCATION

NOTE: Certain source variables that were used to create recoded variables have valid values that might not have been reported or assigned for the current survey year. However, these values have been included in the general specifications in the codebook on how the recoded variables were created. See additional details about this issue in the Organization of the Data File section of this codebook introduction.

NOTE: The following NSDUH college enrollment variables, COLLENRLFT and COLLENRLST, were revised during the 2016 NSDUH due to questionnaire changes impacting the source variables. COLLENRLFT and COLLENRLST are available starting with the 2016 NSDUH and are considered comparable with the 2015 versions, COLLENRFT and COLLENRST.

A respondent was defined as a full-time college student if they were aged 18 to 22, enrolled in school (EDUSCHLGO =1, 3, 5, 11), enrolled at the college level (EDUSCHGRD2=9-11), and a full-time student (EDUFULPAR=1). Respondents in the category "Other Persons Aged 18-22" include those not enrolled in school, enrolled in college part-time, enrolled in other grades either full or part-time, or enrolled with no other information available. Respondents aged 18-22 who reported don't know, refused, or blank to being enrolled in school (EDUSCHLGO= 94, 97, 98), their school enrollment level (EDUSCHGRD2=98) and their full or part time status (EDUFULPAR=94, 97, 98) are defined as system missing.

(AGE2, EDUFULPAR, EDUSCHGRD2, EDUSCHLGO)

COLLENRLFT Len : 1 RC-COLLEGE ENROLLMENT-FULL TIME

	Freq	Pct
. = Unknwn Enrollment, Aged 18-22 (See comment above).....	233	0.71
1 = Full Time College Student Aged 18-22 (See comment above) .....	1671	5.08
2 = Other Persons Aged 18-22 (See comment above).....	2764	8.40
3 = Persons Aged 12-17, 23 or Older.....	28225	85.81

A respondent was defined as a full or part-time college student if they were aged 18 to 22, enrolled in school (EDUSCHLGO=1, 3, 5, 11), enrolled at the college level (EDUSCHGRD2=9-11), and either a full-time student (EDUFULPAR=1) or part-time (EDUFULPAR=2) student. Respondents aged 18-22 who reported don't know, refused, or blank to being enrolled in school (EDUSCHLGO=94, 97, 98), their school enrollment level (EDUSCHGRD2=98), and their full or part time status (EDUFULPAR=94, 97, 98) are defined as system missing. Otherwise, a respondent was defined as not enrolled in college (EDUSCHLGO=2, 4) or in the category "Other Persons Aged 18-22" (enrolled in other grades either full or part-time, or enrolled with no other information available).

(AGE2, EDUFULPAR, EDUSCHGRD2, EDUSCHLGO)

## HEALTH INSURANCE

**HEALTH INSURANCE**

The next questions are about [SAMPLE MEMBER POSS] health insurance coverage and the kinds and amounts of income that [SAMPLE MEMBER] and other people in your family receive. This information will help in planning health care services and finding ways to lower costs of care.

NOTE: Beginning in 2003, respondents under the age of 65 who reported that they were covered by Medicare were asked to confirm their answer.

Several government programs provide medical care or help pay medical bills.

Medicare is a health insurance program for people aged 65 and older and for certain people with disabilities. Is [SAMPLE MEMBER A] covered by Medicare?

(QHI01, QHI01V)	Len : 2	COVERED BY MEDICARE	Freq	Pct
<u>MEDICARE</u>

## IMPUTED HEALTH INSURANCE

### IMPUTED HEALTH INSURANCE

Starting in 2002, missing values in the variables describing the type of health insurance were imputed. In particular, missing values in the edited variables MEDICARE, CAIDCHIP (Medicaid/children's state-assisted health insurance), CHAMPUS, PRVHLTIN (private health insurance), and a modified version of HLTTINOS (other health insurance) were imputed. The overall health insurance variable was then created by combining the information from the detailed imputation-revised variables in the variable IRINSUR4. This differs from the method used in 1999-2001 where the edited health insurance variables were combined before imputation to create a recoded overall health insurance variable (INSUR3), the missing values of which were imputed in the variable IRINSUR3. As in previous years, missing values in PRVHLTIN were imputed. However, the name has changed (IRPINSUR in 1999-2001, IRPRVHLT in 2002) to reflect the fact that the imputation of missing values in PRVHLTIN was univariate from 1999-2001, and multivariate (with the other detailed variables) in 2002.

## RECODED HEALTH INSURANCE

### RECODED HEALTH INSURANCE

NOTE: The variable HLCALLFG is a created "flag" variable that indicates when a respondent (or proxy) reported that the respondent was covered by all of the following: Medicare, Medicaid, the Children's Health Insurance Program (if aged 12 to 19), military health care, and private health insurance. The variable HLCALL99 also is a created "flag" variable that indicates when respondents were reported to be covered by Medicare, Medicaid, military health care, and private health insurance. This HLCALL99 variable is comparable to HLCALLFG in 1999, when these four types of health insurance were the only types of current coverage that were asked about in the interview.

<u>HLCALLFG</u>	Len : 2 FLAG IF EVERY FORM OF HEALTH INS REPORTED	<b>Freq</b>	<b>Pct</b>

## RECODED INCOME

**RECODED INCOME**

NOTE: The variables in this section are recoded variables that were created from one or more of the edited or imputed variables from the two preceding sections.

The following variable, GOVTPROG, was created by examination of these government assistance program variables: Supplemental Security Income (IRFAMSSI), food stamps (IRFSTAMP), cash assistance (IRFAMPMT), and non-cash assistance (IRFAMSVC).

(IRFAMPMT, IRFAMSSI, IRFAMSVC, IRFSTAMP)

**GOVTPROG** Len : 1 RC-PARTICIPATED IN ONE OR MORE GOVT ASSIST PROGRAMS

	Freq	Pct
1 = Yes (Any source variable=1) .....	5264	16.00
2 = No (All source variables=2).....	27629	84.00

**INCOME**

Len : 1 RC-TOTAL FAMILY INCOME RECODE

	Freq	Pct
1 = Less than \$20,000 .....	4917	14.95
2 = \$20,000 - \$49,999 .....	8163	24.82
3 = \$50,000 - \$74,999 .....	5017	15.25
4 = \$75,000 or More .....	14796	44.98

The following variable, POVERTY3, indicates a person's family income relative to poverty thresholds. The U.S. Census Bureau assigns a poverty threshold for each combination of family size and number of children in the household. To be at 100% of the poverty threshold is equivalent to having a family income that is the same as the poverty threshold. A poverty level less than 100% indicates having a family income less than the poverty threshold and therefore defined by the Federal government as living in poverty. A poverty level greater than 100% indicates having a family income greater than the poverty threshold. The previously created variable POVERTY2, was created using the recoded version of family income that had a top-coded level of \$100,000 or more. Starting in 2015, the finer income questions were revised to expand the top level to include the responses \$100,000 - \$149,999 and \$150,000 or more. The variable POVERTY3 account for these additional income levels through the use of the finer family income variable. Despite these changes, POVERTY3 is considered comparable with POVERTY2.

POVERTY3 was created for each individual based on their poverty threshold (determined by their age, family size, the number of children in the household, and total family income). Since NSDUH only collects categorical values of family income, for each level of income, the midpoint of each range was assigned as the effective family income. The highest level of income, \$150,000 or more, was assigned a value of \$180,000. Prior to the questionnaire change in 2015 that expanded the top level of income categories, the highest level of income was \$100,000 or more and the assigned family income was \$120,000. Family income was divided by the poverty threshold and multiplied by 100 to show family income as a percentage of the federal poverty threshold. Respondents aged 18 to 22 currently living in a college dormitory (GQTYPE2='C') were set to system missing and do not have a valid value for this variable.

**POVERTY3**

Len : 1 RC-POVERTY LEVEL (% OF US CENSUS POVERTY THRESHOLD)

	Freq	Pct
. = Persons Aged 18-22 in a College Dorm (See comment above).....	125	0.38
1 = Living in Poverty (See comment above).....	4767	14.49
2 = Income Up to 2X Fed Pov Thresh (See comment above) .....	5655	17.19
3 = Income More Than 2X Fed Pov Thresh (See comment above).....	22346	67.94

## COUNTY

GEOGRAPHICCOUNTY

The variable PDEN10 is based on 2010 Census data and the December 2009 Core Based Statistical Area classifications provided by the Office of Management and Budget (OMB).

<u>PDEN10</u>	Len : 1 POPULATION DENSITY 2010 - THREE LEVELS	<b>Freq</b>	<b>Pct</b>
	1 = Segment in a CBSA with 1 million or more persons.....	13768	41.86
	2 = Segm. in a CBSA with fewer than 1 million persons.....	17001	51.69
	3 = Segment not in a CBSA.....	2124	6.46

NOTE: COUTYP4 is recoded based on the 2013 Rural/Urban Continuum Codes.

<u>COUTYP4</u>	Len : 1 COUNTY METRO/NONMETRO STATUS (2013 3-LEVEL)	<b>Freq</b>	<b>Pct</b>
	1 = Large Metro .....	14647	44.53
	2 = Small Metro .....	12308	37.42
	3 = Nonmetro.....	5938	18.05

## SEGMENT

### **SEGMENT**

The Census provides data for five types of American Indian areas (AIAs):

- Federally-recognized American Indian reservations (AIRs) and off-reservation trust land areas – areas that have been set aside by the U.S. for the use of American Indian tribes. The tribes have primary governmental authority over the AIRs and associated off-reservation trust lands. Federal AIRs may cross State and all other area boundaries.
- State-recognized American Indian Reservations (SAIRs) - reservations established by some State governments for tribes recognized by the State. The tribes may have governmental authority over the SAIRs. SAIRs must be defined within a single State but may cross county and other types of boundaries.
- Oklahoma tribal statistical areas (OTSAs) - areas intended to represent the former American Indian reservations that existed in Indian and Oklahoma territories prior to Oklahoma statehood in 1907. OTSAs are contained within the State of Oklahoma but may cross all other area boundaries.
- Tribal designated statistical areas (TDSAs) - areas identified and delineated for federally-recognized American Indian tribes that do not currently have an AIR or off-reservation trust land. A TDSA is intended to encompass a compact and contiguous area that contains a concentration of individuals who identify with the delineating federally-recognized American Indian tribe. TDSAs may cross State and all other area boundaries.
- State designated tribal statistical areas (SDTSAs) - areas identified and delineated for State-recognized tribes that are not federally-recognized and do not have an AIR or off-reservation trust land. SDTSAs provide State-recognized tribes without reservations statistical data for a geographic area that encompasses a substantial concentration of tribal members. SDTSAs must be defined within a single State but may cross county and other types of boundaries.

The AIAs are mutually exclusive, i.e., no AIA can overlap another AIA. In cases where more than one tribe claims jurisdiction over an area, the Census Bureau creates a joint-use area as a separate entity to define this area of dual claims.

Some NSDUH segments can cross more than one AIA. In order to assign a single AIA to a segment, a 'majority' AIA variable was created by summing the total number of dwelling units within each of the AIAs within the segment and then assigning the AIA with the most dwelling units to that segment. The resulting 'majority' AIAs were summarized to form MAIIN102. MAIIN102 is based on 2010 census data.

<u>MAIIN102</u>	Len : 1 MAJORITY AMER INDIAN AREA INDICATOR FOR SEGMENT	Freq	Pct
1 = Segment in an American Indian area .....	453	1.38	
2 = Segment not in an American Indian area .....	32440	98.62	

## BLOCK

### **BLOCK**

The Census provides data for five types of American Indian areas (AIAs):

- Federally-recognized American Indian reservations (AIRs) and off-reservation trust land areas – areas that have been set aside by the U.S. for the use of American Indian tribes. The tribes have primary governmental authority over the AIRs and associated off-reservation trust lands. Federal AIRs may cross State and all other area boundaries.
- State-recognized American Indian Reservations (SAIRs) - reservations established by some State governments for tribes recognized by the State. The tribes may have governmental authority over the SAIRs. SAIRs must be defined within a single State but may cross county and other types of boundaries.
- Oklahoma tribal statistical areas (OTSAs) - areas intended to represent the former American Indian reservations that existed in Indian and Oklahoma territories prior to Oklahoma statehood in 1907. OTSAs are contained within the State of Oklahoma but may cross all other area boundaries.
- Tribal designated statistical areas (TDSAs) - areas identified and delineated for federally-recognized American Indian tribes that do not currently have an AIR or off-reservation trust land. A TDSA is intended to encompass a compact and contiguous area that contains a concentration of individuals who identify with the delineating federally-recognized American Indian tribe. TDSAs may cross State and all other area boundaries.
- State designated tribal statistical areas (SDTSAs) - areas identified and delineated for State-recognized tribes that are not federally-recognized and do not have an AIR or off-reservation trust land. SDTSAs provide State-recognized tribes without reservations statistical data for a geographic area that encompasses a substantial concentration of tribal members. SDTSAs must be defined within a single State but may cross county and other types of boundaries.

The AIAs are mutually exclusive, i.e., no AIA can overlap another AIA. In cases where more than one tribe claims jurisdiction over an area, the Census Bureau creates a joint-use area as a separate entity to define this area of dual claims.

The variable AIIND102 is based on 2010 census data and is defined by mapping the census block in which a respondent resides to the 2010 census file.

<u>AIIND102</u>	Len : 1 AMER INDIAN AREA INDICATOR		<b>Freq</b>	<b>Pct</b>
	1 = Census block in an American Indian area.....		459	1.40
	2 = Census block not in an American Indian area .....		32434	98.60

Codebook Creation Date: 10/25/2021 .....618

## **Appendix A**

### **Drug Codes for Open-Ended Questions**

The final drug codes for the 2020 National Survey on Drug Use and Health (NSDUH) were created from answers that respondents specified for use, misuse,<sup>1</sup> or treatment (including perceived need for treatment) for substances other than those that respondents were asked about directly in the interview. These responses are often referred to in NSDUH as “OTHER, Specify” data. Respondents in the 2020 NSDUH could specify (a) use in their lifetime of other hallucinogens or inhalants; (b) misuse in the past 12 months of other prescription drugs (pain relievers, tranquilizers, stimulants, or sedatives); (c) use of a needle in their lifetime to inject other drugs besides cocaine, heroin, or methamphetamine; (d) other substances for which they felt they needed treatment in the past 12 months; and (e) other substances for which they last received treatment in the past 12 months or for which they were currently receiving treatment.

This appendix does not include the codes for cough and cold medications mentioned in the special drugs section (edited variables COLDYR1 through COLDYR5) or for drugs mentioned in the consumption of alcohol section for medication-assisted treatment (edited variables ALMOTHSP1 through ALMOTHSP3 and OPMOTHSP1 through OPMOTHSP3). The cough and cold medicine and medication-assisted treatment codes are unique to those measures.

The substance use questions in NSDUH underwent a major redesign in 1999, and the prescription drug questions underwent a major redesign in 2015. Consequently, codes for certain drugs may differ from those used in prior survey years.

In particular, the number of specific prescription drugs in the interview has been greatly expanded since 2015. Also, questions about misuse of specific prescription drugs typically ask about a single drug rather than a group of similar drugs. In the 2014 NSDUH, for example, question TR01 for tranquilizers asked respondents about lifetime use of “Klonopin or Clonazepam that was not prescribed for you or that you took only for the experience or feeling it caused.” Code 246 in the 2014 NSDUH was assigned if respondents specified Klonopin®, the generic equivalent clonazepam, or similar drugs that contained clonazepam. In addition to the reference period for misuse changing in 2015 from the lifetime to the 12 months prior to the interview, separate questions were included in 2015 for misuse in the past 12 months of Klonopin® or for misuse of the generic equivalent clonazepam. Because of this change, code 246 since 2015 has been assigned when respondents specifically mentioned misuse of Klonopin®, and code 2504 has been assigned since 2015 if respondents specified misuse of clonazepam. As much as possible, cross references have been included to indicate prior or similar codes.

Another important change to the coding of “OTHER, Specify” drug data since the 2015 NSDUH has been to create new codes in the 6000 series for animal tranquilizers that formerly were coded as tranquilizers or in the 8000 series for drugs such as antidepressants or antipsychotic medications that previously were assigned codes in the series for sedatives (codes of 101-199 and 1001-1999), tranquilizers (codes of 201-299 and 2001-2999), stimulants (codes of 301-399 and 3001-3999), or pain relievers (codes of 401-499 and 4001-4999). Especially prior to the 1999 survey, prescription drugs historically may have been assigned codes according to where they first were mentioned. For example, the antipsychotic drug Thorazine® was first

---

<sup>1</sup> Misuse of prescription drugs also has been referred to in NSDUH as “nonmedical” use. Since 2015, misuse of prescription drugs has been defined as use “in any way a doctor did not direct you to use it/them.” Examples of misuse provided to respondents include (a) use without a prescription of your own; (b) use in greater amounts, more often, or longer than directed; or (c) use in any other way not directed by a doctor.

specified prior to the 1999 survey and was assigned a code of 227, in the series for tranquilizers. Any mentions of this drug will be coded as 8512 in 2015 and beyond. For these new codes in the 8000 series, reference to the former codes is made as much as possible in the numeric listing of codes.

Since 2019, the alphabetical listing of drug code definitions has been discontinued from this appendix. Data users who know the name of a drug or part of a drug's name can search for that drug in the electronic codebook using the appropriate search function (e.g., Ctrl-F for .docx files in Microsoft Word or PDF files in Adobe Acrobat if using a computer with a Windows operating system). Listed below are guidelines for online searching of the electronic appendix for drug codes.

- Do not require searches to be case sensitive. For example, searching for the term “bromo” will take data users to code 698 (2C-B, Bromo mescaline, Nexus), in which “Bromo” is capitalized, and code 6173 (2,5-dimethoxy-4-bromoamphetamine, Brolamfetamine, DOB), in which “bromo” is not capitalized.
- Search for alternate text strings if an initial search does not identify the code being sought. For example, code 698 includes the text string “2C-B.” In a search that is not case sensitive, code 698 will not be identified by searching for “2cb” without the hyphen or for “2-cb” instead of “2c b.” However, code 698 will be identified by shortening the search to “2c” or by searching for an alternative text string, such as “bromo.”
- Please be aware when searching for drug codes that some drugs are very similar in nomenclature or spelling. For example, the code level definitions for 2,5-Dimethoxy-4-methylphenethylamine (code 6154) and 2,5 Dimethoxy-4-methylthiophenethylamine (code 6159) differ only in terms of the “thio” text for code 6159. These two codes will be identified in searches for “dimethoxy,” “methyl,” or “phenethylamine.” Data users could therefore incorrectly choose the drug corresponding to code 6154 when they intended to find the drug corresponding to code 6159, or vice versa. Therefore, data users are encouraged to examine all results from a search to avoid choosing an incorrect code from a similarly named drug.

**Table A.1 Numeric Listing of Drug Codes for Open-Ended Questions, 2020 NSDUH Computer-Assisted Interviewing**

<b>Code</b>	<b>Definition</b>
101	Butisol
102	Buticaps
103	Amytal
104	Mebaral
105	Placidyl, Ethchlorvynol
106	Doriden
107	Noludar
108	Nembutal
109	Seconal
110	Tuinal
111	Dalmane [see also 1502]
112	Restoril [see also 1503]
113	Halcion [see also 1504]
114	Amobarbital
115	Phenobarbital
116	Methaqualone, Sopor, Quaalude [see also 138]
117	Chloral hydrate, Noctec
118	Pentobarbital, Pentothal, Sodium pentothal, Thiopental
119	Secobarbital
120	Downers; OTHER Sedative, NOT OTHERWISE SPECIFIED
121	USED SEDATIVE, DON'T KNOW NAME
122	Over-the-counter sleep aid; not specified <OTC>
123	Unisom <OTC>
124	Yellow jackets
126	Sominex <OTC>
127	Nytol <OTC>
128	Nervine <OTC>
129	Reds
130	Promethazine
132	Sleepettes <OTC>
137	7-14
138	Mandrax, Mandrix [see also 116]
139	Black widows
142	Belladonna
145	Red devil(s)
146	Bentyl, Dicyclomine
152	Eskabarbs
153	Luminal
154	Alurate
156	Sodium barbital

<b>Code</b>	<b>Definition</b>
157	Barbiturates
159	Octanox
163	Blue meanies
164	Yellow zombies
171	NyQuil <OTC>
172	Dream Ease <OTC>
173	Wafers
174	Ambien [see also 1501]
176	Melatonin <OTC>
177	Bean
179	Water tee [sic]
180	Tylenol P.M. <OTC>
181	Excedrin P.M. <OTC>
182	Melzone
184	Red and blues
186	Butalbital
187	Belladonna plant/flower/root, deadly nightshade
188	Prosom
189	Sonata, Zaleplon
190	Dormin <OTC>
191	Blues
194	Quiet World <OTC>
195	Lotusate, Talbutal
196	Simply Sleep <OTC>
197	Topamax
198	Seducaps
201	Valium [see also 2506]
202	Librium [see also 2507]
203	Limbitrol [see also 276]
204	Menrium
205	Serax [see also 2508]
206	Tranxene
207	Ativan [see also 2503]
208	Centrax
209	Xanax [see also 2501, 2502]
210	Paxipam
211	BuSpar [see also 2511]
212	Miltown [see also 220]
213	Equanil [see also 220]
214	Deprol
215	Vistaril [see also 2512]
216	Atarax [see also 2512]
217	Durrax

<b>Code</b>	<b>Definition</b>
219	SK-Lygen
220	Meprobamate
221	OTHER Tranquilizer, NOT OTHERWISE SPECIFIED
222	USED TRANQUILIZER, DON'T KNOW NAME
223	Methocarbamol
229	Librax
234	Flexeril [see also 2509]
237	Midazolam
242	Equagesic
246	Klonopin [see also 2504, 2505]
260	PCB
266	Verstran
268	Rohypnol, Flunitrazepam, roche, roofies
276	Limbital DS [see also 203]
278	Benzodiazepines
281	Blue ringer
288	Baclofen
290	Metaxalone, Skelaxin
296	Novoxapam
297	Cafia
301	Dexedrine
302	Dexamyl
303	Eskatrol
304	Benzedrine
305	Biphetamine
306	Desoxyn
307	Tenuate [see also 3505]
308	Tepanil
309	Didrex [see also 3504]
310	Plegine
311	Preludin
312	Ionamin
313	Adipex-P [see also 3507]
314	Pondimin, Fenfluramine
315	Voranal
316	Sanorex
317	Mazanor
318	Ritalin [see also 3502]
319	Cylert
320	Dextroamphetamine
321	Methedrine
322	Methamphetamine ("ice" or "crank"), Meth [see also 3126]
323	Obedrin-L.A.

<b>Code</b>	<b>Definition</b>
324	Uppers; OTHER Stimulant, NOT OTHERWISE SPECIFIED
325	USED STIMULANT, DON'T KNOW NAME
326	White cross
327	Black beauties, black beauty
328	Pink hearts
329	Bird's eggs, robin's eggs, speckled eggs
330	Blue birds, blue jays, blue robins, speckled bird
331	Blancs, whites
332	Ephedrine
333	357 Magnum, Magnum 44 <OTC>
334	Crossroads, cross tops
336	Diet pills
337	White molly
339	Amphetamines, otherwise unspecified
341	Pink roses
342	Purple hearts
344	Bennies
345	Black molly
346	Marax
347	Phenylpropanolamine
348	Crystal
349	Phendimetrazine [see also 3506]
351	Cathinone, cat, khat, q'at
352	Lemons
353	No-Doz <OTC>
354	Vivarin <OTC>
355	Crystal meth
356	Dexies
357	Heart-shaped black pills
358	20/20
359	Criss cross
360	Rainbow speed
363	Bam(s)
364	Pseudoephedrine <OTC>
366	Duromine
368	Peanut butter crank
374	Christmas tree(s)
376	TAC
377	Albuterol
379	Hearts
380	Pink ladies
381	P.O.T.C.

<b>Code</b>	<b>Definition</b>
382	Footballs, pink footballs, purple footballs
383	Pre-Sate
384	Little crosses
385	Little pink ones
386	Herbal ecstasy
388	Pink lemon
390	Max Alert
394	Debs
395	Black cats
396	Black RJs, RJ8
398	Pink crosses
401	Darvon
402	Dolene
403	SK-65
404	Wygesic
405	Levo-Dromoran
406	Percodan
407	Demerol [see also 4511]
408	Dilauidid, Hydromorphone
409	Tylenol with Codeine, Tylenol 3, Tylenol 4
410	Phenaphen with Codeine, Phenaphen 3
411	Talwin
412	Talwin NX
413	Talacen
414	Propoxyphene
415	Codeine pills [see also 4506]
416	Anileridine
417	Morphine
418	Methadone [see also 4512]
419	Stadol, Stadol NS
420	OTHER Analgesic, NOT OTHERWISE SPECIFIED
421	USED ANALGESIC, DON'T KNOW NAME
422	Motrin
423	Percocet
424	Fioricet
425	Advil <OTC>
426	Fiorinal
427	Darvocet, Darvocet-N
429	Frost 222
430	Aspirin, Ecotrin, Empirin <OTC>
431	Tylox
432	Rufen

<b>Code</b>	<b>Definition</b>
433	Paregoric
434	Vicodin [see also 4501, 4502, 4503, 4504]
435	Tylenol, Tylenol Extra-Strength <OTC>
436	Bufferin <OTC>
438	Anaprox, Naprosyn, Naproxen, Naxen
439	222, Canadian 222
442	Ibuprofen
443	Diflunisal, Dolobid
444	Aspirin with Codeine, Empirin 3, Empirin 4
445	Norgesic Forte
447	Synalgos, Synalgos DC
450	Acetaminophen, including non-Tylenol brands <OTC>
453	Organidin with Codeine
454	Novocain, Procaine
455	Fiorinal with Codeine
457	T's and blues, tee's and b's, tops and bottoms
458	Mepergan, Mepergan Fortis
462	Norflext, Orphenadrine
465	Fentanyl [see also 4508, 4509]
466	Midol <OTC>
467	Tolectin
468	Excedrin <OTC>
469	Leritine
470	Cafergot
471	Butazolidin
472	Indocin, Indomethacin
473	Pyridium
476	Duradrin, Isocom, Midrin
477	Melumbrina, Neo-Melumbrina
478	Nogirtronia
480	Robitussin AC with Codeine
481	Acular, Dolac, Ketorolac tromethamine, Torradlo
487	Ariel
490	Nalbuphine, Nubain
491	PDR
495	Red cross
496	Ultram
498	Mefenamic acid, Ponstan, Ponstel
499	Aleve <OTC>
501	Gasoline or lighter fluids

<b>Code</b>	<b>Definition</b>
502	Spray paints
503	Other aerosol sprays
504	Shoeshine liquid, glue, or toluene; Super Glue; rubber cement; airplane or model glue; chemical glue
505	Lacquer thinner or other paint solvents
506	Amyl nitrite, "poppers," locker room odorizer, "rush," isobutyl nitrate, bolt
507	Halothane, ether, or other anesthetics; chloroform
508	Nitrous oxide, "whippets," dentist gas
509	Correction fluids, degreasers, cleaning fluids, Liquid Paper [see also 524], K2r spot remover, Typewash
510	OTHER Inhalant, NOT OTHERWISE SPECIFIED
511	Markers, felt-tip pens, ink pens, Sharpies
512	Incense
516	CHC, chlorofluorocarbon, Freon, refrigerant
517	Toluol
518	Acetone, nail polish remover
519	Helium
520	Old paint, paint
521	Propane [see also 525, 544]
522	Liquid TV (MTV), TV tuner, TV11Y
523	Matches
524	White-Out [see also 509]
525	Butane [see also 521, 544]
526	Nail polish
527	Phenyl nitrate
528	Whipped-cream can
529	Moth balls
531	Candy, powdered candy, sugar
533	Window sealant
534	Deodorant [see also 827]
536	Fire halt
537	Air horn, boat horn, condensed horn

<b>Code</b>	<b>Definition</b>
539	ScotchGard
540	PAM
541	Binaca
542	Brasso, lens cleaner, spirits of ammonia, smelling salts
543	Liquid oxygen, oxygen
544	Lighter gases, not specified [see also 521, 525]
545	Car tailpipe exhaust fumes, Carbon monoxide, CO, gasoline motor exhaust fumes
546	Leather protector, suede protector
548	Cologne, isopropanol vapors, rubbing alcohol, perfume
550	Methyl chloride
551	Oven cleaner
553	Pixie sticks
554	Insect killer (e.g., Raid)
555	Chillers
556	Energine
557	Hagwash [sic], Hogwash
558	Kool Aid
559	LOLOY
560	Dishwashing detergent, laundry detergent, soap
561	Amputee gas cleanser
562	Ban apple gas
563	Acetylene
564	Electric contact cleaner
565	Trichloroethane
566	Smoked tea from Lipton tea bag
567	Pertussin spray
568	Tally
569	Peganento
571	Black jack
572	Etam
573	Furniture polish
574	Tornado
576	C.A.T.
577	Rave runners
580	Medusa
582	WD-40
585	TCL
586	Carbon from empty soft drink bottle
587	Mineral ice
588	Antifreeze
589	Tire shine/tire cleaner

<b>Code</b>	<b>Definition</b>
590	Canned air, compressed air
591	Air brush propellant, air brush cartridge
592	Computer air duster, computer cleaner, dust-off, dust X
594	Starting fluid
595	Chlorine
596	Femo clay
597	Trichloronitrate
598	Ethylene dichloride
599	Potpourri
601	LSD ("acid") [see also 618]
602	Peyote
603	Mescaline
604	Psilocybin (mushrooms), sclerotia, shrooms
605	PCP ("angel dust," phencyclidine)
606	"Ecstasy" (MDMA), X-TC, "X"
607	OTHER Hallucinogen, NOT OTHERWISE SPECIFIED
609	Jimson weed
610	Crystal T
611	Greens
612	Happy stick, sherm, sherman, shermstick
613	Duckweed
614	MDA, Methylenedioxy amphetamine
615	Homemade drugs
616	DET, Dimethyltryptamine, DMT
617	Morning glory seeds, morning glory tendrils, ricea
618	Acid paper, blotter (acid) [see also 601]
619	Tic
620	Blue dragon
621	Red dragon
622	Microdot(s), green microdot, purple microdot
623	Mickey, mickey mouse club, mickey mousers
624	Orange sunshine, sunshine, yellow sunshine
625	Window, window pane, 4-way pane, 4-way
626	Jet fuel

<b>Code</b>	<b>Definition</b>
627	Hawaiian wood rose, Hawaiian Woodrose seeds
628	Hawaiian rosebud seed tea
629	Rocket Fuel
630	Black Owsley
631	Purple Owsley
633	Mr. Natural
634	Unicorn
635	Ginseng seeds, ginseng weed
636	DOM, STP
637	Purple haze
639	Nutmeg, Mace
640	Purple pyramid
642	Pink Floyd
643	Mount queen, queen
645	Thai stick
648	Designer drugs
650	Datura stramonium, daytura, thorn apple
651	Mellow Yellow
652	ALD-52
653	Cricket, cricketshit
654	Eve
655	Flying elephant
656	Mars
657	Orange barrel
658	Special K, Ketamine
659	Boat
660	Bufofenin , Toad, toad licking
662	Kanepolin
663	Animal tranquilizer, horse tranquilizer
664	Purple fingers
665	Paniolis
666	Zonick
668	Yellow tiny pills
669	Stropharia
670	Monkey dust
672	Suncrush
673	Orange
674	Pee-pope
677	Skunk II
678	Banana peels
679	Hell bells
681	Lovely
682	Kif
686	Spider in my feet

<b>Code</b>	<b>Definition</b>
687	Spray
688	AMP
690	RID
691	Maximum impact
693	Lemon drops
695	Angel's trumpet, floripondio
698	2C-B, Bromo mescaline, Nexus
699	BOHA-49B
701	OTHER Opiates, NOT OTHERWISE SPECIFIED
702	Heroin
703	Opium, otherwise unspecified
704	Dope
705	Speedball (heroin + cocaine)
706	Smack
707	Black tar heroin
709	Poppy
710	Laudanum, opium tincture
711	Shirka
801	OTHER Drugs, NOT OTHERWISE SPECIFIED
802	THC, cannabinol, marinol, tetrahydrocannabinol
803	Marijuana, MarrJane [sic], Mary Jane, MJ, pot, weed, hemp
804	Hashish
805	Cocaine, coca, cocaína, coke, perico, Coca
806	Crack, rock
807	Alcohol, beer, ethanol, EtOH, pink champagne
808	All of the ones I've tried
809	Pills
810	Freebase
812	Cigars
813	Cigarettes, tobacco (type unspecified)
814	Caffeine <OTC>
815	Coffee <OTC>
816	Smokeless tobacco, snuff, chewing tobacco
817	Hard stuff
818	Nicotine
819	Inderal, Propranolol
820	Penicillin
821	Amoxicillin, Ampicillin, Pentrexyl

<b>Code</b>	<b>Definition</b>
822	Rabbit tobacco
824	Steroids
825	Theo-Dur
826	Alupent
827	Aluminum chloride [see also 534]
828	Tetracycline
829	Robitussin DM <OTC>
830	Mad bull
831	Honey oil
832	Primo
833	Bone
834	Loveboat
836	Antabuse
837	Paris 400
840	Over-the-counter cough medicine (contents unspecified) <OTC>
841	Allerest <OTC>, Contac <OTC>
843	Antihistamine, cold medicine, cold tablets <OTC>
844	Blood pressure medication
846	Erythromycin
847	GHB, NSC, gamma hydroxybutyrate
848	Liquid vitamin, vitamin pills <OTC>
849	Monosodium glutamate (MSG) <OTC>
850	Slack
852	Formaldehyde, wak [sic], whack (embalming fluid)
854	Juice
857	Wicki stick
858	Antibiotic
865	Diuretics, water pills
866	Boomers
867	Boron
873	Contraceptives, Ferutal, Mircette, Ortho Novum,
874	Premarin
875	Buds
876	Glass
877	Methazolamide
880	Frios
881	YLOALE
883	Dextromethorphan hydrobromide <OTC>
884	Snow
885	Drixoral <OTC>

<b>Code</b>	<b>Definition</b>
886	Spanish fly
891	Famotidine, Pepcid
892	Carafate, Sucralfate
893	Estrogen
894	Depakene, Depakote, Valproic acid
895	Tagamet, Cimetidine
896	Catapres, Clonidine
897	Synthroid, Levothyroxine
898	Propylene
899	Bromophen
900	Not a drug
900	Non-drug reason given for a drug
1001	Benadryl, Diphenhydramine <OTC>
1003	Donnatal
1004	Valerian <OTC>
1005	Imovane, Zopiclone
1006	Oxcarbazepine, Trileptal
1007	Robitussin P.M. <OTC>
1008	Rohr 714, Rorer 714
1009	Mogadon
1010	Diprivan
1011	Eszopiclone, Lunesta
1012	Brevital
1013	Ambien CR
1014	Tylenol Flu Nighttime <OTC>
1015	Wild lettuce
1016	Phenazepam
1017	Rozerem
1018	Advil PM <OTC>
1019	Donormyl <OTC>
1022	Atropine
1023	Relaxen <OTC>
1024	Homemade sedative
1025	Acetaminophen P.M., including non-Tylenol brands <OTC>

## **Appendix C**

### **Tobacco Brand Codes for Open-Ended Questions**

The final tobacco brand codes were created from listings of brands that appeared on the computer screen(s) corresponding to that particular type of tobacco, or from answers that respondents specified, if they indicated use of “a brand not on this list.” For each tobacco product (cigarettes and cigars), the available responses in the contiguous order of appearance on the screen (based on the 1999 through 2004 computer-assisted interviewing instruments) were used to initially create each tobacco product group. Although the tobacco brands that appeared on the screens for respondents changed beginning in 2005 for cigarettes, snuff, and cigars, the editing and coding procedures in this survey year continued to use existing codes that had been developed prior to 2005. For example, American Spirit cigarettes became the first brand on the screen for question CG11 in 2005 (“The next questions are about the brand of cigarettes you smoke—the brand is the name that is on the pack. During the past 30 days, what brand of cigarettes did you smoke most often?”). For consistency with prior years, however, mention of American Spirit cigarettes continues to retain a code of 161, even though CG11=1 (with this answer verified in question CG13) would indicate that the respondent smoked American Spirit cigarettes most often in the past 30 days.

In addition, questions about smokeless tobacco brands have not been included in the questionnaire since 2015. However, if respondents in 2015 or later years specify a chewing tobacco or snuff brand in connection with the questions for cigarette and cigar brands, then the reported brand would be assigned the relevant chewing tobacco or snuff code shown in this appendix.

Tobacco brand codes 100-199 and 1000-1999 represent cigarette brands, codes 200-299 and 2000-2999 represent chewing tobacco brands, codes 300-399 and 3000-3999 represent snuff brands, and codes 400-499 and 4000-4999 represent cigar brands. Additional codes were added to each group list as needed. Miscellaneous tobacco and non-tobacco groups are represented by the 500-599, 600-699, 700-799, and 800-899 series.

For tobacco brands that respondents could choose from a list, no distinction was made in the coding between situations where respondents chose that particular brand from the list, and those where respondents reported use of “a brand not on this list” and then specified use of that brand. In addition, there was no distinction between particulars such as menthol, light, or full-flavor varieties in the coding. In addition, the coding considered situations where respondents might specify a brand that corresponded to a different type of tobacco. For example, if a brand of little cigars was specified as a brand of “cigarettes,” then the reported brand of “cigarettes” was assigned a code in the 400 or 4000 series, corresponding to cigars.

Since 2019, the alphabetical listing of tobacco brand code definitions has been discontinued from this appendix. Data users who know the name of a tobacco brand or part of a tobacco brand’s name can search for that brand in the electronic codebook using the appropriate search function (e.g., Ctrl-F for .docx files in Microsoft Word or PDF files in Adobe Acrobat). Listed below are guidelines for online searching of the electronic appendix for tobacco brand codes.

- Do not require searches to be case sensitive. For example, doing a case-sensitive search for “De “ (i.e., capital “D” and letter “e,” followed by a space) will identify codes 469 (Hoya De Monterrey) and 472 (Hoya De Nicaragua) but not codes 4038

(Flor de Oliva Grand Cameroon) or 4189 (Memoria de Cuba). Similarly, using a case-sensitive search for “Aura” will not identify code 1425 (aura) because the brand name does not use capital letters.

- When searching for tobacco brands that include one or more numbers as part of their brand name, please be aware that the search results could identify numeric codes of other tobacco brands. For example, doing a search for “305” will identify codes 1139 (305’s cigarettes) and 4458 (305’s cigars). The search will also identify numeric codes for the following other tobacco brands: 1305 (DJ Mix), 305 (Kodiak), and 4305 (Guatemalan cigars; brand unspecified).
- “Roll-your-own” brands of loose cigarette tobacco can be identified by searching for “roll-your-own” without data users needing to know an exact brand name.
- Search for alternate text strings if an initial search does not identify the code being sought. For example, code 1329 is for Smoker’s Choice cigarettes. In a search that is not case sensitive, code 1329 will not be identified by searching for “smokers” without the apostrophe. However, code 1329 can be identified by shortening the search to “smoker” or by searching to an alternative text string, such as “choice.”
- Please be aware when searching for tobacco brand codes that different kinds of tobacco products can have the same brand name. For example, code 1086 is for Smoker Friendly cigarettes, code 4155 is for Smoker Friendly cigars, and code 548 is for Smoker Friendly pipe tobacco.

## **Appendix D**

### **Nicotine Dependence and Substance Use Disorder**

## D.1 Introduction

The 2020 National Survey on Drug Use and Health (NSDUH) computer-assisted interviewing (CAI) instrumentation included questions that were designed to measure dependence on nicotine (cigarettes) and illicit drug<sup>1</sup> or alcohol use disorder. Illicit drug or alcohol use disorder is also referred to as substance use disorder (SUD). This appendix includes information on the definitions, comparability, analysis details, and coding specifications of the variables that measure nicotine dependence and SUD. The variable specifications are provided for nicotine dependence and SUD, respectively, within separate sections of this appendix.

### D.1.1 Nicotine (Cigarette) Dependence and SUD Measures

For nicotine (cigarettes), questions pertaining to dependence were based on criteria from the Nicotine Dependence Syndrome Scale (NDSS; Shiffman et al., 1995; Shiffman et al., 2004) and the Fagerstrom Test of Nicotine Dependence (FTND; Fagerstrom, 1978; Heatherton et al., 1991). These criteria were first used to measure nicotine dependence in NSDUH in 2003.

For substances other than nicotine (cigarettes), which include alcohol, marijuana, cocaine, heroin, methamphetamine, prescription pain relievers, prescription sedatives, prescription stimulants, prescription tranquilizers, hallucinogens, and inhalants, the 2020 questionnaire contained two versions of the SUD questions. The first set of questions were based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994). The second set of questions were based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013).

As described above, there are two versions of the SUD questions in the 2020 questionnaire, but each respondent received only one version of the SUD questions. The DSM-5 version of the SUD questions was asked as part of the Clinical Validation Study (CVS) that was originally planned for the first 6 months of the 2020 NSDUH. Selection into the CVS sample was based on responses to survey questions located earlier in the questionnaire on cigarette, alcohol, and marijuana use. Logic in the NSDUH questionnaire then assigned respondents to the CVS.

Respondents selected for the CVS (i.e., “CVS respondents”) received the revised SUD questions that were based on the DSM-5-specific criteria. Respondents who were not selected for the CVS received the existing SUD questions (based on the DSM-IV criteria) in the dependence and abuse questionnaire section. Respondents who were not selected for the CVS also received supplemental questions in the emerging issues section of the questionnaire about additional DSM-5-specific criteria that were not covered by the existing DSM-IV-based questions. These additional questions were on craving, marijuana withdrawal, and tranquilizer withdrawal. Otherwise, respondents selected for the CVS sample completed the same sections in the same order as other NSDUH interview respondents. The CVS data were not retained on the public use file for disclosure reasons; therefore, the remainder of this appendix focuses on the coding specifications that applies to the non-CVS data.

---

<sup>1</sup> Illicit drugs included marijuana, cocaine, heroin, hallucinogens, inhalants, methamphetamine, and the misuse of prescription psychotherapeutic drugs (i.e., pain relievers, tranquilizers, stimulants, and sedatives).

The SUD variables in the 2020 NSDUH that are based on the DSM-IV criteria were created consistently with the SUD variables in the 2019 NSDUH and have the same variable names across years. Respondents were asked the DSM-IV questions in the dependence or abuse section of the questionnaire. Respondents are still required to have met the same number of DSM-IV criteria as in past years to be classified as having an SUD based on the DSM-IV criteria. The SUD variables based on the DSM-5 criteria were new in 2020 and were used to produce the estimates presented in the 2020 detailed tables (Center for Behavioral Health Statistics and Quality [CBHSQ], 2021b) and the 2020 first findings report (Substance Abuse and Mental Health Services Administration [SAMHSA], 2021). New questions were added to the questionnaire in 2020 to enable the production and validation of DSM-5-based estimates.

### **D.1.2 Impact of Coronavirus Disease 2019 on the 2020 NSDUH**

The coronavirus disease 2019 (COVID-19) pandemic made 2020 a unique year within the history of NSDUH. Quarter 1 (January to March 2020) was completed using standard NSDUH protocols with in-person data collection. Given the public health emergency related to COVID-19 and considering the safety of field staff and the public, NSDUH in-person data collection was suspended on March 16, 2020, including the CVS.<sup>2</sup> For weighting, imputation, and estimation, the small number of Quarter 3 (i.e., July data) interviews were grouped with the Quarter 4 data. For simplicity, references of Quarter 4 in the 2020 detailed tables, refers to the combined Quarters 3 and 4 data. Estimates for nicotine (cigarette) dependence and for SUD based on the DSM-5 criteria shown in the 2020 detailed tables (CBHSQ, 2021b) were calculated using data from combined Quarters 1 and 4 of 2020. Except for a very brief data collection effort that tested increased safety measures in July, no data were collected in Quarters 2 and 3 (i.e., April to September). SAMHSA decided to produce estimates for 2020 using the combined data to increase the sample sizes and resulting precision of the estimates. To protect respondents' confidentiality, the variable QUARTER was removed from the file so that no analyses can be performed by quarter. Given the differences in data collection periods and other methodological procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from prior years in the 2020 detailed tables and the first findings report (SAMHSA, 2021). Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years. Caution should also be used when attempting to distinguish the effects on estimates due to real changes in the population (e.g., COVID-19, other events) from the effects due to methodological changes. Regardless, general information on how to compare, combine, and weight the nicotine (cigarette) dependence and SUD data across survey years, including 2020, is provided in this appendix. Caveats regarding the 2020 data are also provided where applicable. See Chapters 2, 3, and 6 of the 2020 methodological summary and definitions for additional details (CBHSQ, 2021a).

### **D.1.3 Comparability between Years and Versions of SUD**

#### **D.1.3.1 Nicotine (Cigarette) Dependence**

The same criteria to measure nicotine (cigarette) dependence were used in 2020 as in past years. Even though the variables were created consistently with variables from prior years, caution

---

<sup>2</sup> The original target of 1,500 NSDUH respondents for the CVS sample was not achieved because of the suspension of NSDUH data collection in March 2020. There was no subsequent resumption of data collection for the CVS.

is advised when comparing the 2020 NSDUH with prior years due to the methodological changes for 2020, as noted above.

### D.1.3.2 SUD

People were classified under the DSM-5 criteria as having an SUD for a given substance if they had two or more of the criteria applicable for that substance. In contrast, people were classified under the DSM-IV criteria as having an SUD if they met criteria for dependence or abuse. People were classified as having dependence if they had three or more of the DSM-IV dependence criteria for a given substance. People were classified as having abuse if they did not meet criteria for dependence but had one or more of the abuse criteria. Although DSM-5 assesses many of the same criteria as DSM-IV, it does not use the diagnoses of dependence and abuse.

The specific criteria used to assess whether someone has an SUD also differ between DSM-5 and DSM-IV. A summary of the differences in criteria can be seen in Table 3.8 of the 2020 methodological summary and definitions (CBHSQ, 2021a).

- DSM-5 (but not DSM-IV) includes a criterion for whether someone had a strong craving or urge to use the substance.
- DSM-5 (but not DSM-IV) includes a withdrawal criterion for cannabis (i.e., marijuana).
- DSM-IV includes a criterion about whether use of a substance caused people to do things that repeatedly got them in trouble with the law. This “legal troubles” criterion for DSM-IV is not included in the SUD criteria for DSM-5.

Due to the differences in the criteria and the scoring algorithm for the DSM-5 and the DSM-IV, the two sets of SUD variables are not comparable with each other.

As noted above, the 2020 SUD variables based on the DSM-IV criteria are defined similarly to past NSDUHs, and, as such, retained the same names as the 2019 NSDUH. For 2020, the version of SUD variables based on the DSM-IV criteria were created from the questions from the dependence or abuse section of the questionnaire. Even though the DSM-IV version of the SUD variables was created similarly to prior years, caution is advised when comparing the 2020 NSDUH with prior years due to the methodological changes for 2020.

The new 2020 SUD variables based on the DSM-5 criteria were given new names that include a “5” to indicate the criteria based on the DSM-5 were used in the definition. For 2020, the version of the SUD variables based on the DSM-5 criteria were created from the questions from the dependence or abuse section of the questionnaire plus the supplemental questions on the DSM-5-specific criteria that were added to the emerging issues section of the questionnaire.

The change from DSM-IV to DSM-5 criteria for estimating SUD led to a break in the comparability of 2020 SUD estimates with estimates from prior years. Consequently, tables and reports for the 2020 NSDUH present SUD estimates only for 2020. Because SUD estimates using the DSM-5 criteria started a new baseline in 2020, the modified predictive mean neighborhood (modPMN) imputation method was used to impute missing DSM-5 SUD data for alcohol and all illicit drugs beginning in 2020. See Table 3.8 of the 2020 methodological summary and definitions (CBHSQ, 2021a) for a list comparing the DSM-IV and DSM-5 criteria.

#### **D.1.4 Severity Measures**

In addition to the DSM-5 criteria questions used to classify someone with SUD, the 2020 NSDUH included questions asking about the severity of an SUD. The severity of an SUD according to DSM-5 criteria is determined by the number of individual criteria recorded as positive for a particular substance (or category of substances).

- People were classified as having an SUD of mild severity if they met two or three SUD criteria for that substance.
- People were classified as having an SUD of moderate severity if they met four or five SUD criteria for that substance.
- People were classified in the severe SUD category if they met six or more SUD criteria for that substance.

Variables for SUD severity also were created for the 2020 NSDUH according to these definitions and are included on the data file. However, this appendix does not contain specifics for these variables, and published estimates for SUD severity outcomes were not presented in the 2020 detailed tables (CBHSQ, 2021b) or the first findings report (CBHSQ, 2021a). Some of the severity level data was dropped from the file due to disclosure risk.

#### **D.1.5 Analysis Weights and Variance Estimation Variables**

Because the nicotine (cigarette) dependence and the SUD variables based on the DSM-IV criteria are similar to SUD variables in past years, users may want to combine 2020 with prior years of NSDUH data. To do so, the 2020 person-level analysis weight variables names and variance estimation variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. See the Use of Analysis Weights and Variance Estimation Variables section of the codebook introduction for more details. Given the methodological changes for the 2020 NSDUH, caution is advised when comparing 2020 and prior years.

To analyze the 2002 to 2020 nicotine (cigarette) dependence or the SUD variables based on the DSM-IV that are available for those years, users should create a new analysis weight variable that takes on the value of the standard analysis weight (ANALWT\_C) for 2002 to 2019 and the value of the standard analysis weight (ANALWTQ1Q4\_C) for 2020 respondents. Users should also create a new variance estimation stratum variable that takes on the value of VESTR for 2002 to 2019 and the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2002 to 2020. For substances that underwent changes due to the 2015 partial redesign, data are only available starting with the 2015 NSDUH.

SUD variables based on the DSM-5 criteria are new for 2020 and should be analyzed using the 2020 standard analysis weight (ANALWTQ1Q4\_C), variance estimation stratum variable (VESTRQ1Q4\_C), and variance estimation primary sampling unit within stratum variable (VEREP).

Due to the complexity of defining the SUD variables, details regarding the creation of these variables are provided in this appendix.

#### **D.1.6 Differences in Methodologies for Nicotine (Cigarettes) and Other DSM-IV SUD Measures**

Differences exist between the methodologies used for determining dependence on nicotine (cigarettes) and for determining dependence on other substances. For example, to classify as nicotine (cigarette) dependent, a respondent must be a past *month* user of cigarettes. However, to classify as dependent on one of the other substances based on DSM-IV criteria, a respondent must be a past *year* user of that substance. A second difference is that the NDSS questions are imputed at the individual question level, whereas the individual DSM-IV dependence questions are not imputed. Beginning in 2015, the overall dependence (and abuse) indicators for seven of the DSM-IV measures were imputed, but the individual dependence questions themselves were not.<sup>3</sup> For the remaining dependence or abuse DSM-IV measures that were not imputed, the unknown values were treated the same as a response of “no.”

#### **D.1.7 Changes over Time**

Beginning in 2016, an opioid use disorder measure was included in the detailed tables (CBHSQ, 2017b) and first findings reports (Lipari et al., 2017; Park-Lee et al., 2017; SAMHSA, 2017). Respondents were classified as having a past year opioid use disorder if they had either a heroin use disorder or pain reliever use disorder related to their misuse of prescription pain relievers in the past year or if they had both disorders. For 2015 to 2019, estimates of opioid use disorder presented in the detailed tables and the first findings reports were based on the DSM-IV criteria, and the variables used to construct these estimates were considered comparable across those survey years. For 2020, estimates of opioid use disorder in NSDUH tables and reports were based on the DSM-5 criteria and are not comparable with estimates from prior years that were based on DSM-IV criteria. The 2020 data file also includes measures of opioid use disorder based on the DSM-IV criteria (i.e., dependence or abuse), though the comparability of these measures with prior survey years is unknown due to methodological changes introduced in response to COVID-19, and caution is advised when comparing 2020 with prior years.

Beginning in 2018, a tranquilizer or sedative use disorder measure was included in the detailed tables (CBHSQ, 2019) and first findings report (SAMHSA, 2019). Respondents were classified as having a past year tranquilizer or sedative use disorder if they had either a tranquilizer use disorder (i.e., dependence or abuse), a sedative use disorder, or both disorders in the past year. Respondents were not classified as having tranquilizer or sedative use disorder if they did not meet the use disorder criteria for either prescription tranquilizers or prescription sedatives individually in the past year. For 2018 and 2019, estimates of tranquilizer or sedative use disorder presented in the detailed tables and the first findings reports were based on the DSM-IV criteria, and the variables used to construct these estimates were considered comparable across those survey years. For 2020, estimates of tranquilizer or sedative use disorder in NSDUH tables and reports were based on the DSM-5 criteria and are not comparable with estimates from prior years that were based on DSM-IV criteria. Data for use disorder are not available for benzodiazepines, because

---

<sup>3</sup> These seven drugs include hallucinogens, inhalants, methamphetamine, prescription pain relievers, prescription sedatives, prescription stimulants, and prescription tranquilizers.

respondents are asked about use disorder symptoms of sedatives and tranquilizers as aggregate categories and could therefore report symptoms of use disorder that apply to tranquilizers or sedatives that are not benzodiazepines.

Beginning in 2020, a central nervous system (CNS) stimulant use disorder measure based on the DSM-5 criteria was included in the 2020 detailed tables (CBHSQ, 2021b) and the first findings report (SAMHSA, 2021). Respondents were classified as having a past year CNS stimulant use disorder if they had a cocaine use disorder, a methamphetamine use disorder, a prescription stimulant use disorder, or a combination of two or more of these use disorders in the past year. Respondents were not classified as having a CNS stimulant use disorder if they did not meet the use disorder criteria for cocaine, methamphetamine, or prescription stimulants individually in the past year. The data file also includes a CNS stimulant use disorder based on the DSM-IV criteria (i.e., dependence or abuse), though the comparability of these measures with prior survey years is unknown due to methodological changes introduced in response to COVID-19, and caution is advised when comparing 2020 with prior years.

## D.2 Nicotine (Cigarette) Dependence

The 2020 NSDUH CAI questions designed to assess nicotine (cigarette) dependence were based on the NDSS and the FTND. To identify patterns of nicotine (cigarette) dependence within the 2020 NSDUH data, variable indicators were created to measure dependence on nicotine through the use of cigarettes. A respondent was classified as being dependent if he or she met either the NDSS or the FTND criteria for dependence. There was no change in the questions or variables definitions for nicotine (cigarette) dependence for the 2020 NSDUH. But due to the methodological changes noted above, caution is advised when comparing the 2020 NSDUH with prior years. See the 2020 methodological summary and definitions (CBHSQ, 2021a) for more information.

### D.2.1 Nicotine Dependence Syndrome Scale (NDSS)

The conceptual roots of the NDSS are similar to those behind the DSM-IV concept of dependence (Edwards & Gross, 1976). The 2020 NSDUH contains 19 NDSS questions that address five aspects of dependence:

1. Smoking drive (compulsion to smoke driven by nicotine craving and withdrawal)
  - a. After not smoking for a while, you need to smoke in order to feel less restless and irritable (IRCGIRTB)
  - b. When you don't smoke for a few hours, you start to crave cigarettes (IRCGCRV)
  - c. You sometimes have strong cravings for a cigarette where it feels like you're in the grip of a force you can't control (IRCGCRGP)
  - d. You feel a sense of control over your smoking - that is, you can "take it or leave it" at any time (IRCGNCTL)
  - e. You sometimes worry that you will run out of cigarettes (IRCGROUT)
2. Nicotine tolerance
  - a. Since you started smoking, the amount you smoke has increased (IRCGINCR)
  - b. Compared to when you first started smoking, you need to smoke a lot more now in order to be satisfied (IRCGSAT)

- c. Compared to when you first started smoking, you can smoke much, much more now before you start to feel anything (IRCGLMR)
3. Continuous smoking
- a. You smoke cigarettes fairly regularly throughout the day (IRCGRGDY)
  - b. You smoke about the same amount on weekends as on weekdays (IRCGRGWK)
  - c. You smoke just about the same number of cigarettes from day to day (IRCGRGNM)
  - d. It's hard to say how many cigarettes you smoke per day because the number often changes (IRCGNCG)
  - e. It's normal for you to smoke several cigarettes in an hour, then not have another one until hours later (IRCGSLHR)
4. Behavioral priority (preferring smoking over other reinforcing activities)
- a. You tend to avoid places that don't allow smoking, even if you would otherwise enjoy them (IRCGAVD)
  - b. There are times when you choose not to be around your friends who don't smoke because they won't like it if you smoke (friends question - CIGFNLKE)
  - c. Even if you're traveling a long distance, you'd rather not travel by airplane because you wouldn't be allowed to smoke (IRCGPLN)
5. Stereotypy (fixed patterns of smoking)
- a. Do you have any friends who do not smoke cigarettes (friends question - CIGFNSMK)
  - b. The number of cigarettes you smoke per day is often influenced by other things - how you're feeling, or what you're doing, for example (IRCGINFL)
  - c. Your smoking is not affected much by other things. For example, you smoke about the same amount whether you're relaxing or working, happy or sad, alone or with others (IRCGNINF).

Each of these five domains can be assessed as separate measures, but an average score across all domains also can be obtained for overall nicotine dependence (Shiffman et al., 2004). In accordance with the scoring methods described by Shiffman and colleagues, the NDSS algorithm for calculating this average score was based on the respondent's answers to 17 of the 19 questions listed above. The items regarding nonsmoking friends (4b - CIGFNLKE and 5a - CIGFNSMK) were excluded due to higher item nonresponse rates.

For respondents who answered 16 of the 17 NDSS nicotine (cigarette) dependence questions used in the NDSS algorithm, the missing item was imputed using the 16 answered NDSS items as covariates in a weighted least squares regression model. For more information on the imputation of nicotine dependence, see the 2020 editing and imputation report in the NSDUH methodological resource book (MRB; CBHSQ, forthcoming).

Responses to items IRCGIRTB, IRCGCRV, IRCGCRGP, IRCGAVD, IRCGPLN, IRCGROUT, IRCGRGDY, IRCGRGWK, IRCGRGNM, IRCGNINF, IRCGINCR, IRCGSAT, and IRCGLMR were coded from 1 to 5 where

- 1=Not at all true,
- 2=Somewhat true,
- 3=Moderately true,
- 4=Very true, and
- 5=Extremely true.

Responses to items IRCGNCTL, IRCGNCG, IRCGSLHR, and IRCGINFL were reverse coded from 5 to 1 where

- 5=Not at all true,
- 4=Somewhat true,
- 3=Moderately true,
- 2=Very true, and
- 1=Extremely true.

For respondents who reported smoking cigarettes in the past month, the NDSS score, NDSSANSP, was calculated as the sum of the responses to the previous questions divided by 17. This score was calculated only for those who had responses to all 17 questions after imputation. If a respondent did not have valid responses (based on actual reporting and imputation) to all 17 questions, then his or her NDSS score was classified as missing.

A respondent was classified as nicotine dependent, NDSSDNP=1, if the NDSS score was greater than or equal to 2.75. If the NDSS score was less than 2.75 or missing, then the respondent was determined to be nondependent, NDSSDNP=0, based on the NDSS. The threshold of 2.75 was derived by the scale developers by examining the distribution of scores in other samples of smokers who were administered the NDSS, including a contrast of scores obtained for nondependent smokers (chippers) versus heavy smokers (Shiffman et al., 1994).

### **D.2.2 Fagerstrom Test of Nicotine Dependence (FTND)**

The FTND is a multi-item measure of dependence, but much of its ability to discriminate dependent smokers derives from a single item assessing how soon after waking smokers have their first cigarette (Heatherton et al., 1989). Because most nicotine is cleared from the bloodstream overnight, smokers typically wake in nicotine deprivation, and rapid movement to smoke is considered a sign of dependence. A respondent who reported smoking cigarettes in the past month was classified as nicotine dependent based on the FTND, FTNDDNP=1, if the first cigarette smoked was within 30 minutes of waking up on the days he or she smoked (CIGWAKE=1 or 2). All other respondents not meeting this criterion were determined to be nondependent, FTNDDNP=0.

### **D.2.3 Nicotine (Cigarette) Dependence**

Using both the NDSS and the FTND, a respondent was classified as having nicotine (cigarette) dependence in the past month, DNICNP=1, if he or she met either the NDSS (NDSSDNP=1) or FTND (FTNDDNP=1) criteria for dependence.

### D.3 DSM-IV Dependence and Abuse

The 2020 NSDUH CAI questions were designed to assess substance dependence and abuse of alcohol and illicit drugs based on the criteria for dependence and abuse in the DSM-IV (American Psychiatric Association, 1994). For marijuana, inhalants, hallucinogens, and prescription tranquilizers, a respondent was classified as having dependence if he or she met three or more of six standard dependence criteria. Dependence criteria for alcohol, cocaine, heroin, methamphetamine, prescription pain relievers, prescription sedatives, and prescription stimulants include the six standard criteria and an additional withdrawal criterion (seven criteria in total). Here, a respondent was classified as having dependence if he or she met three or more of the seven dependence criteria that pertain to that substance. For each illicit drug and alcohol, a respondent was classified as having abused that substance if he or she met one or more of four abuse criteria and was determined not to be dependent upon the substance of interest.<sup>4</sup>

Dependence and abuse variables are mutually exclusive with dependence taking precedence (i.e., dependence is determined first, and respondents are only classified as having abused a substance if they are not already classified as dependent, regardless of responses to the abuse questions). Therefore, it is possible for the variables showing abuse of a combination of substances to not correspond with the abuse status of those individual substances. For example, a respondent who is classified as having abused cocaine in the past year may be classified as not having abused illicit drugs because he or she was dependent on marijuana and already classified as being dependent on illicit drugs.

In 2015, the NSDUH questionnaire underwent a partial redesign to improve the quality of the NSDUH data and to address the changing needs of policy makers and researchers regarding substance use and mental health issues. The changes to the questionnaire resulted in a new baseline for DSM-IV-based SUD measures of inhalants, hallucinogens, methamphetamine, prescription pain relievers (and therefore opioids), prescription sedatives, prescription stimulants, and prescription tranquilizers (and therefore prescription psychotherapeutics and tranquilizers or sedatives). Given the current editing and imputation procedures, along with the use of multiple sections of the questionnaire to determine whether a respondent was asked the SUD questions, users should be aware of the possible inconsistencies that may exist between the SUD variables and the imputed recency and frequency-of-use variables for selected substances. Responses from the main questions on recency and frequency of substance use were used as criteria to determine whether a respondent was asked the alcohol and/or illicit drug SUD questions. Unknown responses to the questions on recency and frequency of substance use in the main section were imputed. However, the imputation process did not take into account data reported in the special drug CAI sections. Therefore, responses to the SUD questions may be inconsistent with responses to the imputed recency or frequency-of-use questions. These inconsistent responses remained in the edited data and were not excluded in the creation of the SUD recodes. Because different sets of criteria were used as skip logic for each substance, different types of inconsistencies between the

---

<sup>4</sup> The 2015 NSDUH and later years contains two versions of the abuse variables. The abuse variables (ABUSEXXX) defined in this appendix incorporate the criteria that a respondent cannot be classified as abusing a substance if he or she is classified as dependent upon that substance. A second set of abuse variables (ABUPOSXXX) are defined solely on the abuse criteria and are independent of a respondent's dependence status. These intermediate abuse variables (ABUPOSXXX) are used in conjunction with dependence variables (DEPNDXXX) to create the DSM-IV version of abuse (ABUSEXXX). More details are provided later in this appendix.

SUD variables and the imputed variables for recency and frequency of substance use could occur by substance.

For alcohol and marijuana, respondents who reported past year use of the respective substance and reported use of the respective substance on more than 5 days in the past year were asked dependence and abuse questions. Respondents who reported substance use in the past year but did not report a valid response for their frequency of substance use data were still asked the dependence and abuse questions. Therefore, inconsistencies could occur where a respondent could be classified as dependent on or had abused a substance, but their *imputed* frequency of use variable indicated less frequent use than the required 5 days in the past year. For heroin, cocaine, and methamphetamine, the criteria included reporting past year use in multiple drug sections. Inconsistencies could occur when responses to questions in the main substance section indicated no use in the past year but positive responses to past year use in a special drug section (i.e., use with a needle) would lead to respondents being routed to the dependence and abuse section and potentially classified as having substance dependence or abuse in the past year.

All other illicit drugs (prescription pain relievers, prescription sedatives, prescription stimulants, prescription tranquilizers, hallucinogens, and inhalants) were revised in the 2015 NSDUH so that respondents were routed into the dependence and abuse sections based only on one criterion: respondent's reported past year use, or misuse for prescription psychotherapeutic drugs, in the main section of the respective substance. Thus, no inconsistencies could occur where the respondent was considered a nonuser of the substance but was classified as being dependent on or abusing the substance.

Dependence and abuse recode methods also changed in the 2015 NSDUH. Prior to the 2015 NSDUH, all dependence or abuse recodes (except nicotine dependence) were created in the same manner using edited data, and all values of unknown were treated as a "no" response. A respondent might have provided ambiguous information about past year use of any individual substance, in which case these respondents were not asked the dependence and abuse questions for that substance. Subsequently, these respondents could be imputed to be past year users of the respective substance. In this situation, the dependence and abuse data were unknown. These respondents with missing SUD measures were then classified as not dependent on or abusing the respective substance, without ever having been asked the dependence and abuse questions. Starting with the 2015 NSDUH, the questionnaire underwent a partial redesign, which included changes to sections that impacted dependence or abuse. Overall, questionnaire changes included a shift in focus for the prescription drug questions from lifetime misuse to past year misuse. Additionally, questions were added about any past year prescription drug use rather than just misuse. New methamphetamine questions were added, replacing the methamphetamine questions that were previously asked within the context of prescription stimulants. New methamphetamine questions were also added to the dependence or abuse section. Substantial changes were also made to questions about inhalants and hallucinogens.

Due to this questionnaire redesign, the dependence and abuse measures of these seven drugs (hallucinogens, inhalants, methamphetamine, prescription pain relievers, prescription sedatives, prescription stimulants, and prescription tranquilizers) broke trend for the dependence and abuse variables for these specific drugs. As a result, new improved imputation methods could be considered since the trends were already broken. A decision was made to also implement the

modPMN imputation method for the indicator level only for their dependence and abuse measures. The imputation process for the dependence and abuse variables is described in detail in the 2020 MRB editing and imputation report (CBHSQ, forthcoming), and the rationale for using modPMN imputation versus zero-fill imputation for SUD measures is provided in Chapter 10 of the evaluation of imputation methods report (CBHSQ, 2017a).

For the four dependence and abuse measures (alcohol, marijuana, cocaine, and heroin) not impacted by the questionnaire redesign, the recoding scheme was not changed. The dependence measures on these four drugs were determined directly from the criteria for dependence in DSM-IV. The final analysis abuse measures for these four drugs were recoded based on the criteria for dependence and abuse in DSM-IV (abuse but not dependence). As in past years, the missing responses for these four measures were treated as the responses of “no” (zero-fill imputation). Due to the questionnaire redesign for certain substances and not others, summary measures such as any illicit drugs, any illicit drugs other than marijuana, and any psychotherapeutic drugs established a new baseline in 2015 and are no longer considered comparable with corresponding variables from prior survey years. Due to the methodological changes noted above, caution is advised when comparing the 2020 dependence or abuse variables with variables from prior years. See the 2020 methodological summary and definitions (CBHSQ, 2021a) for more information.

Additional variables that came from the imputation process are included on the 2020 NSDUH data file. In addition to the original data for each question from the questionnaire that are found in edited form in the Substance Dependence or Abuse codebook section, some new additional variables were created. First, a set of intermediate recoded variables were created during the imputation process for both dependence and abuse. These dependence variables (DEPENDXXX) are defined as “Yes” or “No” for meeting the dependence criteria, and unknown data are set to system missing. The abuse variables (ABUPOSXXX) are defined as “Yes” or “No” for meeting the abuse criteria, and unknown data are set to system missing. These intermediate recoded abuse variables do not take into consideration the respondent’s dependence status and are considered independent abuse variables. These recoded dependence and abuse variables are then imputed independently, and the missing values are assigned to valid categories (Yes, No, Never Used, Did Not Use in Past 12 Months) and can be found in the Imputed Substance Dependence or Abuse codebook section.

The final DSM-IV version of the analysis variables that were included on this data file are found in the Recoded Substance Dependence or Abuse codebook section. The dependence variables are defined by recoding the imputed variables into a final recode defined as only “Yes” or “No.” These final abuse variables were defined by using the imputed independent abuse variables along with the respondent’s dependence status to classify the DSM-IV version of the abuse variables. These final abuse recodes are defined as “Yes” when a respondent meets the abuse criteria and does not have dependence on the substance.

Listed below are the definitions used for each of the individual dependence and abuse measures, as well as specific notes about any inconsistency issues for each measure. The individual measures are divided into either a dependence section or an abuse section. Additional variables that were created using a combination of these individual dependence and abuse measures are described in the Summary Measures of DSM-IV SUD section of this appendix and are also listed in the body of the codebook.

## **D.4 Substance Dependence Measures for Determining DSM-IV SUD**

### **D.4.1 ALCOHOL**

To be classified with alcohol dependence, DEPNDALC, which is a component of the DSM-IV definition of alcohol use disorder, a respondent must have met three or more of these alcohol dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of alcohol (ALCLOTTM=1 or ALCGTOVR=1)
- (2) Used alcohol more often than intended or was unable to keep set limits on alcohol use (ALCKPLMT=2)
- (3) Needed to use alcohol more than before to get desired effects or noticed that same amount of alcohol use had less effect than before (ALCNDMOR=1 or ALCLSEFX=1)
- (4) Inability to cut down or stop using alcohol every time tried or wanted to (ALCCUTEV=2)
- (5) Continued to use alcohol even though it was causing problems with emotions, nerves, mental health, or physical problems (ALCEMCTD=1 or ALCPHCTD=1)
- (6) Alcohol use reduced or eliminated involvement or participation in important activities (ALCLSACT=1)
- (7) Reported experiencing two or more alcohol withdrawal symptoms at the same time that lasted longer than a day after alcohol use was cut back or stopped. Symptoms include (i) sweating or feeling that heart was beating fast; (ii) having hands tremble; (iii) having trouble sleeping; (iv) vomiting or feeling nauseous; (v) seeing, hearing, or feeling things that were not really there; (vi) feeling like could not sit still; (vii) feeling anxious; and (viii) having seizures or fits. (ALCWDSMT=1).

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: The respondents who used alcohol on 5 or fewer days in the past year were not administered the questions for determining alcohol dependence. However, a respondent could answer the dependence questions if he or she reported using alcohol in the past year, even if he or she did not report a valid response to the frequency of days in which he or she drank an alcoholic beverage. Thus, situations may exist where a respondent was classified as dependent on alcohol but drank an alcoholic beverage less than 6 days in the past year according to the imputed frequency of use variable (IRALCFY).

### **D.4.2 MARIJUANA**

To be classified with marijuana dependence, DEPNDMRJ, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these marijuana dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of marijuana (MRJLOTTM=1 or MRJGTOVR=1)
- (2) Used marijuana more often than intended or was unable to keep set limits on marijuana use (MRJKPLMT=2)
- (3) Needed to use marijuana more than before to get desired effects or noticed that same amount of marijuana use had less effect than before (MRJNDMOR=1 or MRJLSEFX=1)
- (4) Inability to cut down or stop using marijuana every time tried or wanted to (MRJCUTEV=2)
- (5) Continued to use marijuana even though it was causing problems with emotions, nerves, mental health, or physical problems (MRJEMCTD=1 or MRJPHCTD=1)
- (6) Marijuana use reduced or eliminated involvement or participation in important activities (MRJLSACT=1)

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: The respondents who used marijuana on 5 or fewer days in the past year were not administered the questions for determining marijuana dependence. However, a respondent could answer the dependence questions if he or she reported using marijuana in the past year, even if he or she did not report a valid response to the frequency of days in which he or she used marijuana. Thus, situations may exist where a respondent was classified as dependent on marijuana but used marijuana less than 6 days in the past year according to the imputed frequency of use variable (IRMJFY).

#### **D.4.3 COCAINE**

To be classified with cocaine dependence, DEPNDCOC, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these cocaine dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of cocaine (COCLLOTTM=1 or COCGTOVR=1)
- (2) Used cocaine more often than intended or was unable to keep set limits on cocaine use (COCKPLMT=2)
- (3) Needed to use cocaine more than before to get desired effects or noticed that same amount of cocaine use had less effect than before (COCNDMOR=1 or COCLSEFX=1)
- (4) Inability to cut down or stop using cocaine every time tried or wanted to (COCCUTEV=2)
- (5) Continued to use cocaine even though it was causing problems with emotions, nerves, mental health, or physical problems (COCEMCTD=1 or COCPHCTD=1)
- (6) Cocaine use reduced or eliminated involvement or participation in important activities (COCLSACT=1)

- (7) Reported feeling blue or down when trying to stop or cut down using cocaine (COCFBLU=1) as well as experiencing two or more additional cocaine withdrawal symptoms at the same time that lasted longer than a day after cocaine use was cut back or stopped. Symptoms include (i) feeling tired or exhausted, (ii) having bad dreams, (iii) having trouble sleeping or sleeping more than normal, (iv) feeling hungry more often, and (v) feeling either very slowed down or like could not sit still. (COCWDSMT=1).

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the dependence questions if he or she reported injecting cocaine with a needle in the past year in the special drugs section, even if he or she reported not using cocaine in the past year in the cocaine section. Thus, situations may exist where a respondent was classified as being dependent on cocaine, even though he or she had not used cocaine in the past year according to the imputed recency variable (COCYR).

#### D.4.4 HEROIN

To be classified with heroin dependence, DEPNDHER, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these heroin dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of heroin (HERLOTTM=1 or HERGTOVR=1)
- (2) Used heroin more often than intended or was unable to keep set limits on heroin use (HERKPLMT=2)
- (3) Needed to use heroin more than before to get desired effects or noticed that same amount of heroin use had less effect than before (HERNDMOR=1 or HERLSEFX=1)
- (4) Inability to cut down or stop using heroin every time tried or wanted to (HERCUTEV=2)
- (5) Continued to use heroin even though it was causing problems with emotions, nerves, mental health, or physical problems (HEREMCTD=1 or HERPHCTD=1)
- (6) Heroin use reduced or eliminated involvement or participation in important activities (HERLSACT=1)
- (7) Reported experiencing three or more heroin withdrawal symptoms at the same time that lasted longer than a day after heroin use was cut back or stopped. Symptoms include (i) feeling kind of blue or down; (ii) vomiting or feeling nauseous; (iii) having cramps or muscle aches; (iv) having teary eyes or a runny nose; (v) feeling sweaty, having enlarged eye pupils, or having body hair standing up on skin; (vi) having diarrhea; (vii) yawning; (viii) having a fever; and (ix) having trouble sleeping. (HERWDSMT=1).

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing

2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the dependence questions if he or she reported injecting with a needle, smoking, sniffing, or snorting heroin in the past year in the special drugs section, even if he or she reported not using heroin in the past year in the heroin section. Thus, situations may exist where a respondent was classified as dependent on heroin, even though he or she had not used heroin in the past year according to the imputed recency variable (HERYR).

#### **D.4.5 HALLUCINOGENS**

To be classified with hallucinogen dependence, DEPNDPYHAL, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these hallucinogen dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of hallucinogens (HALULOTTM=1 or HALUGTOVR=1)
- (2) Used hallucinogens more often than intended or was unable to keep set limits on hallucinogen use (HALUKPLMT=2)
- (3) Needed to use hallucinogens more than before to get desired effects or noticed that same amount of hallucinogen use had less effect than before (HALUNDMOR=1 or HALULSEFX=1)
- (4) Inability to cut down or stop using hallucinogens every time tried or wanted to (HALUCUTEV=2)
- (5) Continued to use hallucinogens even though they were causing problems with emotions, nerves, mental health, or physical problems (HALUEMCTD=1 or HALUPHCTD=1)
- (6) Hallucinogen use reduced or eliminated involvement or participation in important activities (HALULSACT=1)

This recode was created using the edited dependence variable (DEPENDHAL) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDHAL) was converted to the final analysis recode (DEPNDPYHAL). Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the hallucinogen dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

#### **D.4.6 INHALANTS**

To be classified with inhalant dependence, DEPNDPYINH, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these inhalant dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of inhalants (INHLLOTTM=1 or INHLGTOVR=1)

- (2) Used inhalants more often than intended or was unable to keep set limits on inhalant use (INHLKPLMT=2)
- (3) Needed to use inhalants more than before to get desired effects or noticed that same amount of inhalant use had less effect than before (INHLNDMOR=1 or INHLLSEFX=1)
- (4) Inability to cut down or stop using inhalants every time tried or wanted to (INHLCUTEV=2)
- (5) Continued to use inhalants even though they were causing problems with emotions, nerves, mental health, or physical problems (INHLEMCTD=1 or INHLPHCTD=1)
- (6) Inhalant use reduced or eliminated involvement or participation in important activities (INHLLSACT=1)

This recode was created using the edited dependence variable (DEPENDINH) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDINH) was converted to the final analysis recode (DEPNDPYINH). Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the inhalant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

#### **D.4.7 METHAMPHETAMINE**

To be classified with methamphetamine dependence, DEPNDPYMTH, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these methamphetamine dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of methamphetamine (METHLOTTM=1 or METHGTOVR=1)
- (2) Used methamphetamine more often than intended or was unable to keep set limits on methamphetamine use (METHKPLMT=2)
- (3) Needed to use methamphetamine more than before to get desired effects or noticed that same amount of methamphetamine use had less effect than before (METHNDMOR=1 or METHLSEFX=1)
- (4) Inability to cut down or stop using methamphetamine every time tried or wanted to (METHCUTEV=2)
- (5) Continued to use methamphetamine even though it was causing problems with emotions, nerves, mental health, or physical problems (METHEMCTD=1 or METHPHCTD=1)
- (6) Methamphetamine use reduced or eliminated involvement or participation in important activities (METHLSACT=1)
- (7) Reported feeling blue or down when trying to stop or cut down using methamphetamine (METHFLBLU=1) as well as experiencing two or more additional methamphetamine withdrawal symptoms at the same time that lasted longer than a day after methamphetamine use was cut back or stopped. Symptoms include (i) feeling tired or exhausted, (ii) having bad dreams, (iii) having trouble sleeping or sleeping more than normal, (iv) feeling hungry more often, and (v) feeling either very slowed down or like could not sit still. (METHWDSMT=1).

This recode was created using the edited dependence variable (DEPENDMTH) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDMTH) was converted to the final analysis recode (DEPNDPYMTH). Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the methamphetamine dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the dependence questions if he or she reported injecting methamphetamine with a needle in the past year in the special drugs section, even if he or she reported not using methamphetamine in the past year in the methamphetamine section. Thus, situations may exist where a respondent was classified as being dependent on methamphetamine, even though he or she had not used methamphetamine in the past year according to the imputed recency variable (METHAMYR).

#### D.4.8 PRESCRIPTION PAIN RELIEVERS

To be classified with prescription pain reliever dependence, DEPNDPYPNR, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these pain reliever dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of pain relievers (PNRLLOTTM=1 or PNRLGTOVR=1)
- (2) Used pain relievers more often than intended or was unable to keep set limits on pain reliever use (PNRLKPLMT=2)
- (3) Needed to use pain relievers more than before to get desired effects or noticed that same amount of pain reliever use had less effect than before (PNRLNDMOR=1 or PNRLLSEFX=1)
- (4) Inability to cut down or stop using pain relievers every time tried or wanted to (PNRLCUTEV=2)
- (5) Continued to use pain relievers even though they were causing problems with emotions, nerves, mental health, or physical problems (PNRLEMCTD=1 or PNRLPHCTD=1)
- (6) Pain reliever use reduced or eliminated involvement or participation in important activities (PNRLLSACT=1)
- (7) Reported experiencing three or more pain reliever withdrawal symptoms at the same time that lasted longer than a day after pain reliever use was cut back or stopped. Symptoms include (i) feeling kind of blue or down; (ii) vomiting or feeling nauseous; (iii) having cramps or muscle aches; (iv) having teary eyes or a runny nose; (v) feeling sweaty, having enlarged pupils, or having body hair standing up on skin; (vi) having diarrhea; (vii) yawning; (viii) having a fever; and (ix) having trouble sleeping. (PNRLWDSMT=1).

This recode was created using the edited dependence variable (DEPENDPNR) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDPNR) was converted to the final analysis recode (DEPNDPYPNR). Due to the changes in the 2015 NSDUH noted above, this final

analysis recode is not comparable with the prescription pain reliever dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

#### **D.4.9 PRESCRIPTION TRANQUILIZERS**

To be classified with prescription tranquilizer dependence, DEPNPDYTRQ, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these tranquilizer dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of tranquilizers (TRQLLOTTM=1 or TRQLGTOVR=1)
- (2) Used tranquilizers more often than intended or was unable to keep set limits on tranquilizer use (TRQLKPLMT=2)
- (3) Needed to use tranquilizers more than before to get desired effects or noticed that same amount of tranquilizer use had less effect than before (TRQLNDMOR=1 or TRQLLSEFT=1)
- (4) Inability to cut down or stop using tranquilizers every time tried or wanted to (TRQLCUTEV=2)
- (5) Continued to use tranquilizers even though they were causing problems with emotions, nerves, mental health, or physical problems (TRQUEMCTD=1 or TRQLPHCTD=1)
- (6) Tranquilizer use reduced or eliminated involvement or participation in important activities (TRQLLSACT=1)

#### **D.4.10 PRESCRIPTION STIMULANTS**

To be classified with prescription stimulant dependence, DEPNPDYSTM, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these stimulant dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of stimulants (STIMLOTTM=1 or STIMGTOVR=1)
- (2) Used stimulants more often than intended or was unable to keep set limits on stimulant use (STIMKPLMT=2)
- (3) Needed to use stimulants more than before to get desired effects or noticed that same amount of stimulant use had less effect than before (STIMNDMOR=1 or STIMLSEFX=1)
- (4) Inability to cut down or stop using stimulants every time tried or wanted to (STIMCUTEV=2)
- (5) Continued to use stimulants even though they were causing problems with emotions, nerves, mental health, or physical problems (STIMEEMCTD=1 or STIMPHTD=1)
- (6) Stimulant use reduced or eliminated involvement or participation in important activities (STIMLSACT=1)
- (7) Reported feeling blue or down when trying to stop or cut down using stimulants (STIMFLBLU=1) as well as experiencing two or more additional stimulant

withdrawal symptoms at the same time that lasted longer than a day after stimulant use was cut back or stopped. Symptoms include (i) feeling tired or exhausted, (ii) having bad dreams, (iii) having trouble sleeping or sleeping more than normal, (iv) feeling hungry more often, and (v) feeling either very slowed down or like could not sit still. (STIMWDSMT=1).

This recode was created using the edited dependence variable (DEPENDSTM) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDSTM) was converted to the final analysis recode (DEPNDPYSTM). Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

#### D.4.11 PRESCRIPTION SEDATIVES

To be classified with prescription sedative dependence, DEPNDPYSED, which is a component of the DSM-IV definition of use disorder, a respondent must have met three or more of these sedative dependence criteria:

- (1) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of sedatives (SEDVLOTTM=1 or SEDVGTOVR=1)
- (2) Used sedatives more often than intended or was unable to keep set limits on sedative use (SEDVKPLMT=2)
- (3) Needed to use sedatives more than before to get desired effects or noticed that same amount of sedative use had less effect than before (SEDVNDMOR=1 or SEDVLSEFX=1)
- (4) Inability to cut down or stop using sedatives every time tried or wanted to (SEDVVCUTEV=2)
- (5) Continued to use sedatives even though they were causing problems with emotions, nerves, mental health, or physical problems (SEDVEMCTD=1 or SEDVPHCTD=1)
- (6) Sedative use reduced or eliminated involvement or participation in important activities (SEDVLSACT=1)
- (7) Reported experiencing two or more sedative withdrawal symptoms at the same time that lasted longer than a day after sedative use was cut back or stopped. Symptoms include (i) sweating or feeling that heart was beating fast; (ii) having hands tremble; (iii) having trouble sleeping or sleeping more than normal; (iv) vomiting or feeling nauseous; (v) seeing, hearing, or feeling things that were not really there; (vi) feeling like could not sit still; (vii) feeling anxious; and (viii) having seizures or fits. (SEDVWDSMT=1).

This recode was created using the edited dependence variable (DEPENDSED) and imputing it so that all past year users were either classified with dependence or classified without dependence. Then the imputed dependence variable (IRDEPENDSED) was converted to the final analysis recode (DEPNDPYSED). Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription sedative dependence variable from 2014

and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

## **D.5 Substance Abuse Measures for Determining DSM-IV SUD**

### **D.5.1 ALCOHOL**

To be classified with abuse of alcohol, ABUSEALC, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these alcohol abuse criteria in the past year and must not have been dependent upon alcohol in the past year (DEPNDALC=0):

- (1) Serious problems at home, work, or school caused by using alcohol, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(ALCSERPB=1)
- (2) Used alcohol regularly and then did something that might have put you in physical danger (ALCPDANG=1)
- (3) Use of alcohol caused you to do things that repeatedly got you in trouble with the law (ALCLAWTR=1)
- (4) Problems with family or friends that were probably caused by using alcohol (ALCFMFPB=1) and continued to use alcohol even though you thought using alcohol caused these problems (ALCFMCTD=1)

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: The respondents who used alcohol on 5 or fewer days in the past year were not administered the questions for determining alcohol abuse. However, a respondent could answer the abuse questions if he or she reported using alcohol in the past year, even if he or she did not report a valid response to the frequency of days in which he or she drank an alcoholic beverage. Thus, situations may exist where a respondent was classified to have abused alcohol but drank an alcoholic beverage less than 6 days in the past year according to the imputed frequency of use variable (IRALCFY).

### **D.5.2 MARIJUANA**

To be classified with abuse of marijuana, ABUSEMRJ, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these marijuana abuse criteria in the past year and must not have been dependent upon marijuana in the past year (DEPNDMRJ=0):

- (1) Serious problems at home, work, or school caused by using marijuana, such as
  - neglecting their children
  - missing work or school

- doing a poor job at work or school
  - losing a job or dropping out of school  
(MRJSERPB=1)
- (2) Used marijuana regularly and then did something that might have put you in physical danger (MRJPDANG=1)
  - (3) Use of marijuana caused you to do things that repeatedly got you in trouble with the law (MRJLAWTR=1)
  - (4) Problems with family or friends probably caused by using marijuana (MRJFMFPB=1) and continued to use marijuana even though you thought using marijuana caused these problems (MRJFMCTD=1)

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: The respondents who used marijuana on 5 or fewer days in the past year were not administered the questions for determining marijuana abuse. However, a respondent could answer the abuse questions if he or she reported using marijuana in the past year, even if he or she did not report a valid response to the frequency of days in which he or she used marijuana. Thus, situations may exist where a respondent was classified to have abused marijuana but used marijuana less than 6 days in the past year according to the imputed frequency of use variable (IRMJFY).

### D.5.3 COCAINE

To be classified with abuse of cocaine, ABUSECOC, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these cocaine abuse criteria in the past year and must not have been dependent upon cocaine in the past year (DEPNDCOC=0):

- (1) Serious problems at home, work, or school caused by using cocaine, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school  
(COCSERPB=1)
- (2) Used cocaine regularly and then did something that might have put you in physical danger (COCPDANG=1)
- (3) Use of cocaine caused you to do things that repeatedly got you in trouble with the law (COCLAWTR=1)
- (4) Problems with family or friends probably caused by using cocaine (COCFMFPB=1) and continued to use cocaine even though you thought using cocaine caused these problems (COCFMCTD=1)

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing

2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the abuse questions if he or she reported injecting cocaine with a needle in the past year, even if he or she reported not using cocaine in the past year. Thus, situations may exist where a respondent was classified to have abused cocaine, even though he or she had not used cocaine in the past year according to the imputed recency variable (COCYR).

#### D.5.4 HEROIN

To be classified with abuse of heroin, ABUSEHER, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these heroin abuse criteria in the past year and must not have been dependent upon heroin in the past year (DEPNDHER=0):

- (1) Serious problems at home, work, or school caused by using heroin, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school  
(HERSERPB=1)
- (2) Used heroin regularly and then did something that might have put you in physical danger (HERPDANG=1)
- (3) Use of heroin caused you to do things that repeatedly got you in trouble with the law (HERLAWTR=1)
- (4) Problems with family or friends probably caused by using heroin (HERFMFPB=1) and continued to use heroin even though you thought using heroin caused these problems (HERFMCTD=1)

This recoded variable's unknown values are included in the "no" response, and it is comparable with similarly named variables from prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the abuse questions if he or she reported injecting with a needle, smoking, sniffing, or snorting heroin in the past year, even if he or she reported not using heroin in the past year. Thus, situations may exist where a respondent was classified to have abused heroin, even though he or she had not used heroin in the past year according to the imputed recency variable (HERYR).

#### D.5.5 HALLUCINOGENS

To be classified with abuse of hallucinogens, ABUSEPYHAL, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these hallucinogen abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using hallucinogens, such as
  - neglecting their children

- missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school  
(HALUSERPB=1)
- (2) Used hallucinogens regularly and then did something that might have put you in physical danger (HALUPDANG=1)
- (3) Use of hallucinogens caused you to do things that repeatedly got you in trouble with the law (HALULAWTR=1)
- (4) Problems with family or friends probably caused by using hallucinogens (HALUFMFPB=1) and continued to use hallucinogens even though you thought using hallucinogens caused these problems (HALUFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSHAL) was converted to the final analysis recode (ABUSEPYHAL) with restriction on DEPNDPYHAL=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

## **D.5.6 INHALANTS**

To be classified with abuse of inhalants, ABUSEPYINH, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these inhalant abuse criteria in the past year:

(1) Serious problems at home, work, or school caused by using inhalants, such as

  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school  
(INHLSERPB=1)

(2) Used inhalants regularly and then did something that might have put you in physical danger (INHLPDANG=1)

(3) Use of inhalants caused you to do things that repeatedly got you in trouble with the law (INHLLAWTR=1)

(4) Problems with family or friends probably caused by using inhalants (INHLFMFPB=1) and continued to use inhalants even though you thought using inhalants caused these problems (INHLFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSINH) was converted to the final analysis recode (ABUSEPYINH) with restriction on DEPNDPYINH=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

### **D.5.7 METHAMPHETAMINE**

To be classified with abuse of methamphetamine, ABUSEPYMTH, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these methamphetamine abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using methamphetamine, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(METHSERPB=1)
- (2) Used methamphetamine regularly and then did something that might have put you in physical danger (METHPDANG=1)
- (3) Use of methamphetamine caused you to do things that repeatedly got you in trouble with the law (METHLAWTR=1)
- (4) Problems with family or friends probably caused by using methamphetamine (METHFMFPB=1) and continued to use methamphetamine even though you thought using methamphetamine caused these problems (METHFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSMTH) was converted to the final analysis recode (ABUSEPYMTH) with restriction on DEPNDPYMT=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

Note: A respondent could answer the abuse questions if he or she reported injecting methamphetamine with a needle in the past year in the special drugs section, even if he or she reported not using methamphetamine in the past year in the methamphetamine section. Thus, situations may exist where a respondent was classified as having abused methamphetamine, even though he or she had not used methamphetamine in the past year according to the imputed recency variable (METHAMYR).

### **D.5.8 PRESCRIPTION PAIN RELIEVERS**

To be classified with abuse of prescription pain relievers, ABUSEPYPNR, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these pain reliever abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using pain relievers, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school

- (PNRLSERPB=1)
- (2) Used pain relievers regularly and then did something that might have put you in physical danger (PNRLPDANG=1)
  - (3) Use of pain relievers caused you to do things that repeatedly got you in trouble with the law (PNRLLAWTR=1)
  - (4) Problems with family or friends probably caused by using pain relievers (PNRLFMPB=1) and continued to use pain relievers even though you thought using pain relievers caused these problems (PNRLFMCND=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSPNR) was converted to the final analysis recode (ABUSEPYPNR) with restriction on DEPNDYPN=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

#### **D.5.9 PRESCRIPTION TRANQUILIZERS**

To be classified with abuse of prescription tranquilizers, ABUSEPYTRQ, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these tranquilizer abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using tranquilizers, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school  
(TRQLSERPB=1)
- (2) Used tranquilizers regularly and then did something that might have put you in physical danger (TRQLPDANG=1)
- (3) Use of tranquilizers caused you to do things that repeatedly got you in trouble with the law (TRQLLAWTR=1)
- (4) Problems with family or friends probably caused by using tranquilizers (TRQLFMFPB=1) and continued to use tranquilizers even though you thought using tranquilizers caused these problems (TRQLFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSTRQ) was converted to the final analysis recode (ABUSEPYTRQ) with restriction on DEPNDPYTRQ=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

## **D.5.10 PRESCRIPTION STIMULANTS**

To be classified with abuse of prescription stimulants, ABUSEPYSTM, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these stimulant abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using stimulants, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(STIMSERPB=1)
- (2) Used stimulants regularly and then did something that might have put you in physical danger (STIMPDANG=1)
- (3) Use of stimulants caused you to do things that repeatedly got you in trouble with the law (STIMLAWTR=1)
- (4) Problems with family or friends probably caused by using stimulants (STIMFMFPB=1) and continued to use stimulants even though you thought that using stimulants caused these problems (STIMFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSSTM) was converted to the final analysis recode (ABUSEPYSTM) with restriction on DEPNDPYSTM=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

## **D.5.11 PRESCRIPTION SEDATIVES**

To be classified with abuse of prescription sedatives, ABUSEPYSED, which is a component of the DSM-IV definition of use disorder, a respondent must have met one or more of these sedative abuse criteria in the past year:

- (1) Serious problems at home, work, or school caused by using sedatives, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(SEDVSRPB=1)
- (2) Used sedatives regularly and then did something that might have put you in physical danger (SEDVPDANG=1)
- (3) Use of sedatives caused you to do things that repeatedly got you in trouble with the law (SEDVLAWTR=1)
- (4) Problems with family or friends probably caused by using sedatives (SEDVFMFPB=1) and continued to use sedatives even though you thought using sedatives caused these problems (SEDVFMCTD=1)

The imputation was conducted in order to define all missing values into valid response categories. Then the imputed abuse variable (IRABUPOSSED) was converted to the final analysis recode (ABUSEPYSED) with restriction on DEPNDPYSED=0. Due to the changes in the 2015 NSDUH noted above, this final analysis recode is not comparable with the prescription stimulant dependence variable from 2014 and prior years. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

## **D.6 Summary Measures of DSM-IV SUD**

In addition to these use disorder recodes based on the DSM-IV criteria, the following summary measures were created using combinations of those recodes. In addition to these summary measures below, variables that combine the dependence and abuse measures (e.g., ABODALC, alcohol dependence or abuse in past year) are also available, and a full list of those can be found in the Recoded Substance Dependence and Abuse section of the codebook. Use disorder measures based on the DSM-IV are also available for composite recodes that are described in the Changes over Time section. These include opioids, tranquilizers or sedatives, and CNS stimulants.

The list of substances included in the definition of the illicit drugs measure did not change with the 2015 redesign, but the substances themselves were impacted by the redesign changes, thus making the summary measures for illicit drugs not comparable with those in years prior to 2015. The measure for alcohol is comparable with years prior to 2015 but not when paired with the illicit drugs measure. Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

### **D.6.1 Dependence Recodes**

#### **D.6.1.1 ILLICIT DRUGS**

To be classified with illicit drug dependence, DEPNDPYILL, a respondent must have been classified as dependent on at least one of the following substances: marijuana (DEPNDMRJ), hallucinogens (DEPNDPYHAL), inhalants (DEPNDPYINH), methamphetamine (DEPNDPYMTH), cocaine (DEPNDCCOC), heroin (DEPNDHER), prescription pain relievers (DEPNDPYPNR), prescription sedatives (DEPNDPYSED), prescription stimulants (DEPNDPYSTM), or prescription tranquilizers (DEPNDPYTRQ).

#### **D.6.1.2 ILLICIT DRUGS OTHER THAN MARIJUANA**

To be classified with illicit drug dependence other than marijuana, DEPNDPYIEM, a respondent must have been classified as dependent on at least one of the following substances: hallucinogens (DEPNDPYHAL), inhalants (DEPNDPYINH), methamphetamine (DEPNDPYMTH), cocaine (DEPNDCCOC), heroin (DEPNDHER), prescription pain relievers (DEPNDPYPNR), prescription sedatives (DEPNDPYSED), prescription stimulants (DEPNDPYSTM), or prescription tranquilizers (DEPNDPYTRQ). A respondent's marijuana dependency status is not considered in the creation of this variable.

### **D.6.1.3 ILLICIT DRUGS OR ALCOHOL**

To be classified with illicit drug or alcohol dependence, DPPYILLALC, a respondent must have been classified as dependent on either illicit drugs (DEPNDPYILL) or alcohol (DEPNDALC).

### **D.6.1.4 PRESCRIPTION PSYCHOTHERAPEUTICS**

To be classified with prescription psychotherapeutics dependence, DEPNDPYPSY, a respondent must have been classified as dependent on at least one of the following: prescription pain relievers (DEPNDPYPNR), prescription sedatives (DEPNDPYSED), prescription stimulants (DEPNDPYSTM), or prescription tranquilizers (DEPNDPYTRQ).

## **D.6.2 Abuse Recodes**

### **D.6.2.1 ILLICIT DRUGS**

To be classified with illicit drug abuse, ABUSEPYILL, a respondent must have been classified as abusing at least one of the following substances: marijuana (ABUSEMRJ), hallucinogens (ABUSEPYHAL), inhalants (ABUSEPYINH), methamphetamine (ABUSEPYMTH), cocaine (ABUSECOC), heroin (ABUSEHER), prescription pain relievers (ABUSEPYPNR), prescription sedatives (ABUSEPYSED), prescription stimulants (ABUSEPYSTM), or prescription tranquilizers (ABUSEPYTRQ), and not dependent on illicit drugs (DEPNDPYILL=0).

### **D.6.2.2 ILLICIT DRUGS OTHER THAN MARIJUANA**

To be classified with illicit drug abuse other than marijuana, ABUSEPYIEM, a respondent must have been classified as abusing at least one of the following substances: hallucinogens (ABUSEPYHAL), inhalants (ABUSEPYINH), methamphetamine (ABUSEPYMTH), cocaine (ABUSECOC), heroin (ABUSEHER), prescription pain relievers (ABUSEPYPNR), prescription sedatives (ABUSEPYSED), prescription stimulants (ABUSEPYSTM), or prescription tranquilizers (ABUSEPYTRQ), and not dependent on illicit drugs other than marijuana (DEPNDPYIEM=0).

### **D.6.2.3 ILLICIT DRUGS OR ALCOHOL**

To be classified with illicit drug or alcohol abuse, ABPYILLALC, a respondent must have been classified as abusing either illicit drugs (ABUSEPYILL) or alcohol (ABUSEALC), and not dependent on illicit drugs or alcohol (DPPYILLALC=0).

### **D.6.2.4 PRESCRIPTION PSYCHOTHERAPEUTICS**

To be classified with prescription psychotherapeutics abuse, ABUSEPYPSY, a respondent must have been classified as abuse of at least one of the following: prescription pain relievers (ABUSEPYPNR), prescription sedatives (ABUSEPYSED), prescription stimulants (ABUSEPYSTM), or prescription tranquilizers (ABUSEPYTRQ).

## D.7 DSM-5 SUD

This section describes the recodes specific to the DSM-5 versions of use disorder measures. Listed below are the definitions used for each of the individual SUD measures along with the corresponding severity variable names. Specific notes about any inconsistency issues for each measure are also included. Additional variables that were created using a combination of these individual SUD measures are described in the Summary Measures of DSM-5 SUD section of this appendix and are also listed in the body of the codebook. These new SUD measures based on the DMS-5 criteria are new for 2020 and do not exist in prior years.

Missing values for the use disorder and use disorder severity measures for alcohol, marijuana, cocaine, heroin, inhalants, hallucinogens, methamphetamine, pain relievers, stimulants, sedatives, and tranquilizers were replaced with valid response categories using statistical imputation. However, the individual criteria variables were not imputed and may contain missing values.

### D.7.1 ALCOHOL

To be classified with alcohol use disorder, IRPYUD5ALC, a respondent must have met two or more of the following alcohol criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5ALC=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5ALC=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5ALC=3).

- (1) Used alcohol more often than intended or was unable to keep set limits on alcohol use (ALCKPLMT=2)
- (2) Inability to cut down or stop using alcohol every time tried or wanted to (ALCCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of alcohol (ALCLOTTM=1 or ALCGTOVR=1)
- (4) Had a strong urge to use alcohol (SDALURGEED=1)
- (5) Serious problems at home, work, or school caused by using alcohol, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(ALCSERPB=1)
- (6) Problems with family or friends that were probably caused by using alcohol (ALCFMFPRB=1) and continued to use alcohol even though you thought using alcohol caused these problems (ALCFMCTD=1)
- (7) Alcohol use reduced or eliminated involvement or participation in important activities (ALCLSACT=1)
- (8) Used alcohol regularly and then did something that might have put you in physical danger (ALCPDANG=1)
- (9) Continued to use alcohol even though it was causing problems with emotions, nerves, mental health, or physical problems (ALCEMCTD=1 or ALCPHCTD=1)

- (10) Needed to use alcohol more than before to get desired effects or noticed that same amount of alcohol use had less effect than before (ALCNDMOR=1 or ALCLSEFX=1)
- (11) Reported experiencing two or more alcohol withdrawal symptoms after alcohol use was cut back or stopped. Symptoms include (i) sweating or feeling that heart was beating fast; (ii) having hands tremble; (iii) having trouble sleeping; (iv) vomiting or feeling nauseous; (v) seeing, hearing, or feeling things that were not really there; (vi) feeling like could not sit still; (vii) feeling anxious; and (viii) having seizures or fits. (ALCW2SX=1).

Note: The respondents who used alcohol on 5 or fewer days in the past year were not administered the questions for determining alcohol use disorder. However, a respondent could answer the SUD questions if he or she reported using alcohol in the past year, even if he or she did not report a valid response to the frequency of days in which he or she drank an alcoholic beverage. Thus, situations may exist where a respondent was classified as having an alcohol use disorder but drank an alcoholic beverage less than 6 days in the past year according to the imputed frequency of use variable (IRALCFY).

## **D.7.2 MARIJUANA**

To be classified with marijuana use disorder, IRPYUD5MRJ, a respondent must have met two or more of the following marijuana criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5MRJ=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5MRJ=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5MRJ=3).

- (1) Used marijuana more often than intended or was unable to keep set limits on marijuana use (MRJKPLMT=2)
- (2) Inability to cut down or stop using marijuana every time tried or wanted to (MRJCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of marijuana (MRJLOTTM=1 or MRJGTOVR=1)
- (4) Had a strong urge to use marijuana (SDMJURGEED=1)
- (5) Serious problems at home, work, or school caused by using marijuana, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school
 (MRJSERPB=1)
- (6) Problems with family or friends probably caused by using marijuana (MRJFMFPB=1) and continued to use marijuana even though you thought using marijuana caused these problems (MRJFMCTD=1)
- (7) Marijuana use reduced or eliminated involvement or participation in important activities (MRJLSACT=1)
- (8) Used marijuana regularly and then did something that might have put you in physical danger (MRJPDANG=1)

- (9) Continued to use marijuana even though it was causing problems with emotions, nerves, mental health, or physical problems (MRJEMCTD=1 or MRJPHCTD=1)
- (10) Needed to use marijuana more than before to get desired effects or noticed that same amount of marijuana use had less effect than before (MRJNDMOR=1 or MRJLSEFX=1)
- (11) Reported experiencing three or more marijuana withdrawal symptoms after marijuana use was cut back or stopped. Symptoms include (i) feeling irritable or angry (SDMJWDLA1ED=1); (ii) feeling anxious or nervous (SDMJWDLA2ED=1); (iii) having trouble sleeping (SDMJWDLA3ED=1); (iv) losing your appetite or losing weight without trying to (SDMJWDLA4ED=1); (v) feeling like you couldn't sit still (SDMJWDLA5ED=1); (vi) feeling depressed (SDMJWDLA6ED=1); and experiencing at least one for the following physical symptoms: stomach ache (SDMJWDLB1ED=1), shaking or tremors (SDMJWDLB2ED=1), sweating (SDMJWDLB3ED=1), fever (SDMJWDLB4ED=1), chills (SDMJWDLB5ED=1), or headache (SDMJWDLB6ED=1).

Note: The respondents who used marijuana on 5 or fewer days in the past year were not administered the questions for determining marijuana use disorder. However, a respondent could answer the SUD questions if he or she reported using marijuana in the past year, even if he or she did not report a valid response to the frequency of days in which he or she used marijuana. Thus, situations may exist where a respondent was classified as having a marijuana use disorder but used marijuana less than 6 days in the past year according to the imputed frequency of use variable (IRMJFY).

### **D.7.3 COCAINE**

To be classified with cocaine use disorder, IRPYUD5COC, a respondent must have met two or more of the following cocaine criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5COC=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5COC=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5COC=3).

- (1) Used cocaine more often than intended or was unable to keep set limits on cocaine use (COCKPLMT=2)
- (2) Inability to cut down or stop using cocaine every time tried or wanted to (COCCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of cocaine (COCLOTTM=1 or COCGTOVR=1)
- (4) Had a strong urge to use cocaine (SDCCURGEED=1)
- (5) Serious problems at home, work, or school caused by using cocaine, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school
 (COCSERPB=1)

- (6) Problems with family or friends probably caused by using cocaine (COCFMFNB=1) and continued to use cocaine even though you thought using cocaine caused these problems (COCFMCTD=1)
- (7) Cocaine use reduced or eliminated involvement or participation in important activities (COCLSACT=1)
- (8) Used cocaine regularly and then did something that might have put you in physical danger (COCPDANG=1)
- (9) Continued to use cocaine even though it was causing problems with emotions, nerves, mental health, or physical problems (COCEMCTD=1 or COCPHCTD=1)
- (10) Needed to use cocaine more than before to get desired effects or noticed that same amount of cocaine use had less effect than before (COCNMDMOR=1 or COCLSEFX=1)
- (11) Reported feeling blue or down when trying to stop or cut down using cocaine (COCLBLU=1) as well as experiencing two or more additional cocaine withdrawal symptoms after cocaine use was cut back or stopped. Symptoms include (i) feeling tired or exhausted, (ii) having bad dreams, (iii) having trouble sleeping or sleeping more than normal, (iv) feeling hungry more often, and (v) feeling either very slowed down or like could not sit still. (COCWDSX=1).

Note: A respondent could answer the cocaine use disorder questions if he or she reported injecting cocaine with a needle in the past year in the special drugs section, even if he or she reported not using cocaine in the past year in the cocaine section. Thus, situations may exist where a respondent was classified as having a cocaine use disorder, even though he or she had not used cocaine in the past year according to the imputed recency variable (COCYR).

#### **D.7.4 HEROIN**

To be classified with heroin use disorder, IRPYUD5HER, a respondent must have met two or more of the following heroin criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5HER=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5HER=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5HER=3).

- (1) Used heroin more often than intended or was unable to keep set limits on heroin use (HERKPLMT=2)
- (2) Inability to cut down or stop using heroin every time tried or wanted to (HERCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of heroin (HERLOTTM=1 or HERGTOVR=1)
- (4) Had a strong urge to use heroin (SDHEURGEED=1)
- (5) Serious problems at home, work, or school caused by using heroin, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school
 (HERSERPB=1)

- (6) Problems with family or friends probably caused by using heroin (HERFMFPB=1) and continued to use heroin even though you thought using heroin caused these problems (HERFMCTD=1)
- (7) Heroin use reduced or eliminated involvement or participation in important activities (HERLSACT=1)
- (8) Used heroin regularly and then did something that might have put you in physical danger (HERPDANG=1)
- (9) Continued to use heroin even though it was causing problems with emotions, nerves, mental health, or physical problems (HEREMCTD=1 or HERPHCTD=1)
- (10) Needed to use heroin more than before to get desired effects or noticed that same amount of heroin use had less effect than before (HERNDMOR=1 or HERLSEFX=1)
- (11) Reported experiencing three or more heroin withdrawal symptoms after heroin use was cut back or stopped. Symptoms include (i) feeling kind of blue or down; (ii) vomiting or feeling nauseous; (iii) having cramps or muscle aches; (iv) having teary eyes or a runny nose; (v) feeling sweaty, having enlarged eye pupils, or having body hair standing up on skin; (vi) having diarrhea; (vii) yawning; (viii) having a fever; and (ix) having trouble sleeping. (HERWD3SX=1).

Note: A respondent could answer the heroin use disorder questions if he or she reported injecting with a needle, smoking, sniffing, or snorting heroin in the past year, even if he or she reported not using heroin in the past year. Thus, situations may exist where a respondent was classified as having a heroin use disorder, even though he or she had not used heroin in the past year according to the imputed recency variable (HERYR).

#### **D.7.5 HALLUCINOGENS**

To be classified with hallucinogen use disorder, IRPYUD5HAL, a respondent must have met two or more of the following hallucinogen criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder; respondents with four or five criteria are considered to have “moderate” disorder; and respondents with six or more criteria are considered to have “severe” disorder.<sup>5</sup>

- (1) Used hallucinogens more often than intended or was unable to keep set limits on hallucinogens use (HALUKPLMT=2)
- (2) Inability to cut down or stop using hallucinogens every time tried or wanted to (HALUCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of hallucinogens (HALULOTTM=1 or HALUGTOVR=1)
- (4) Had a strong urge to use hallucinogens (SDHAURGEED=1)
- (5) Serious problems at home, work, or school caused by using hallucinogens, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school
 (HALUSERPB=1)

---

<sup>5</sup> The corresponding severity-level variable was removed from the file to minimize disclosure risk.

- (6) Problems with family or friends probably caused by using inhalants (HALUFMFPB=1) and continued to use hallucinogens even though you thought using hallucinogens caused these problems (HALUFMCTD=1)
- (7) Hallucinogens use reduced or eliminated involvement or participation in important activities (HALULSACT=1)
- (8) Used hallucinogens regularly and then did something that might have put you in physical danger (HALUPDANG=1)
- (9) Continued to use hallucinogens even though they were causing problems with emotions, nerves, mental health, or physical problems (HALUEMCTD=1 or HALUPHCTD=1)
- (10) Needed to use hallucinogens more than before to get desired effects or noticed that same amount of hallucinogen use had less effect than before (HALUNDMOR=1 or HALULSEFX=1)

## D.7.6 INHALANTS

To be classified with inhalant use disorder, IRPYUD5INH, a respondent must have met two or more of the following inhalant criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder; respondents with four or five criteria are considered to have “moderate” disorder; and respondents with six or more criteria are considered to have “severe” disorder.<sup>6</sup>

- (1) Used inhalants more often than intended or was unable to keep set limits on inhalant use (INHLKPLMT=2)
- (2) Inability to cut down or stop using inhalants every time tried or wanted to (INHLCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of inhalants (INHLLOTTM=1 or INHLGTOVR=1)
- (4) Had a strong urge to use inhalants (SDINURGEED=1)
- (5) Serious problems at home, work, or school caused by using inhalants, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school
 (INHLSERP=1)
- (6) Problems with family or friends probably caused by using inhalants (INHLMFPB=1) and continued to use inhalants even though you thought using inhalants caused these problems (INHLMCTD=1)
- (7) Inhalant use reduced or eliminated involvement or participation in important activities (INHLLSACT=1)
- (8) Used inhalants regularly and then did something that might have put you in physical danger (INHLPDANG=1)
- (9) Continued to use inhalants even though they were causing problems with emotions, nerves, mental health, or physical problems (INHLEMCTD=1 or INHLPHCTD=1)

---

<sup>6</sup> See footnote 5.

- (10) Needed to use inhalants more than before to get desired effects or noticed that same amount of inhalant use had less effect than before (INHLNDMOR=1 or INHLLSEFX=1)

#### D.7.7 METHAMPHETAMINE

To be classified with methamphetamine use disorder, IRPYUD5MTH, a respondent must have met two or more of the following methamphetamine criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5MTH=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5MTH=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5MTH=3).

- (1) Used methamphetamine more often than intended or was unable to keep set limits on methamphetamine use (METHKPLMT=2)
- (2) Inability to cut down or stop using methamphetamine every time tried or wanted to (METHCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of methamphetamine (METHLOTTM=1 or METHGTOVR=1)
- (4) Had a strong urge to use methamphetamine (SDMEURGEED=1)
- (5) Serious problems at home, work, or school caused by using methamphetamine, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(METHSERPB=1)
- (6) Problems with family or friends probably caused by using methamphetamine (METHFMFPB=1) and continued to use methamphetamine even though you thought using methamphetamine caused these problems (METHFMCTD=1)
- (7) Methamphetamine use reduced or eliminated involvement or participation in important activities (METHLSACT=1)
- (8) Used methamphetamine regularly and then did something that might have put you in physical danger (METHPDANG=1)
- (9) Continued to use methamphetamine even though it was causing problems with emotions, nerves, mental health, or physical problems (METHEMCTD=1 or METHPHCTD=1)
- (10) Needed to use methamphetamine more than before to get desired effects or noticed that same amount of methamphetamine use had less effect than before (METHNDMOR=1 or METHLSEFX=1)
- (11) Reported feeling blue or down when trying to stop or cut down using methamphetamine (METHFLBLU=1) as well as experiencing two or more additional methamphetamine withdrawal symptoms after methamphetamine use was cut back or stopped. Symptoms include (i) feeling tired or exhausted, (ii) having bad dreams, (iii) having trouble sleeping or sleeping more than normal, (iv) feeling hungry more often, and (v) feeling either very slowed down or like could not sit still. (MTHWD2SX=1).

Note: A respondent could answer the methamphetamine use disorder questions if he or she reported injecting methamphetamine with a needle in the past year in the special drugs section, even if he or she reported not using methamphetamine in the past year in the methamphetamine section. Thus, situations may exist where a respondent was classified as having a methamphetamine use disorder, even though he or she had not used methamphetamine in the past year according to the imputed recency variable (METHAMYR).

## D.7.8 PRESCRIPTION PAIN RELIEVERS

To be classified with prescription pain reliever use disorder, IRPYUD5PNR, a respondent must have met two or more of the following prescription pain reliever criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5PNR=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5PNR=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5PNR=3).

- (1) Used pain relievers more often than intended or was unable to keep set limits on pain reliever use (PNRLKPLMT=2)
- (2) Inability to cut down or stop using pain relievers every time tried or wanted to (PNRLCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of pain relievers (PNRLLOTTM=1 or PNRLGTOVR=1)
- (4) Had a strong urge to use pain relievers (SDPRURGEED=1)
- (5) Serious problems at home, work, or school caused by using pain relievers, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(PNRLSERPB=1)
- (6) Problems with family or friends probably caused by using pain relievers (PNRLFMFPB=1) and continued to use pain relievers even though you thought using pain relievers caused these problems (PNRLFMCTD=1)
- (7) Pain reliever use reduced or eliminated involvement or participation in important activities (PNRLLSACT=1)
- (8) Used pain relievers regularly and then did something that might have put you in physical danger (PNRLPDANG=1)
- (9) Continued to use pain relievers even though they were causing problems with emotions, nerves, mental health, or physical problems (PNRLEMCTD=1 or PNRLPHCTD=1)
- (10) Needed to use pain relievers more than before to get desired effects or noticed that same amount of pain reliever use had less effect than before (PNRLNDMOR=1 or PNRLLSEFX=1)
- (11) Reported experiencing three or more pain reliever withdrawal symptoms after pain reliever use was cut back or stopped. Symptoms include (i) feeling kind of blue or down; (ii) vomiting or feeling nauseous; (iii) having cramps or muscle aches; (iv) having teary eyes or a runny nose; (v) feeling sweaty, having enlarged pupils, or

having body hair standing up on skin; (vi) having diarrhea; (vii) yawning; (viii) having a fever; and (ix) having trouble sleeping. (PNRLWD3SX=1).

#### D.7.9 PRESCRIPTION TRANQUILIZERS

To be classified with prescription tranquilizer use disorder, IRPYUD5TRQ, a respondent must have met two or more of the following prescription tranquilizer criteria in the past year. More specifically, respondents with two or three criteria are considered to have “mild” disorder (IRPYSEV5TRQ=1); respondents with four or five criteria are considered to have “moderate” disorder (IRPYSEV5TRQ=2); and respondents with six or more criteria are considered to have “severe” disorder (IRPYSEV5TRQ=3).

- (1) Used tranquilizers more often than intended or was unable to keep set limits on tranquilizer use (TRQLKPLMT=2)
- (2) Inability to cut down or stop using tranquilizers every time tried or wanted to (TRQLCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of tranquilizers (TRQLLOTTM=1 or TRQLGTOVR=1)
- (4) Had a strong urge to use tranquilizers (SDTRURGEED=1)
- (5) Serious problems at home, work, or school caused by using tranquilizers, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(TRQLSERPB=1)
- (6) Problems with family or friends probably caused by using tranquilizers (TRQLFMFPB=1) and continued to use tranquilizers even though you thought using tranquilizers caused these problems (TRQLFMCTD=1)
- (7) Tranquilizer use reduced or eliminated involvement or participation in important activities (TRQLLSACT=1)
- (8) Used tranquilizers regularly and then did something that might have put you in physical danger (TRQLPDANG=1)
- (9) Continued to use tranquilizers even though they were causing problems with emotions, nerves, mental health, or physical problems (TRQUEMCTD=1 or TRQLPHCTD=1)
- (10) Needed to use tranquilizers more than before to get desired effects or noticed that same amount of tranquilizer use had less effect than before (TRQLNDMOR=1 or TRQLLSEFT=1)
- (11) Reported experiencing two or more tranquilizer withdrawal symptoms after stopped use was cut back or stopped. Symptoms include (i) sweating or feeling that your heart was beating fast (SDTRWITHD1ED=1); (ii) having your hands tremble (SDTRWITHD2ED=1); (iii) having trouble sleeping (SDTRWITHD3ED =1); (iv) vomiting or having an upset stomach (SDTRWITHD4ED =1); (v) seeing, hearing, or feeling things that weren’t really there (SDTRWITHD5ED =1); (vi) feeling like you

couldn't sit still (SDTRWITHD6ED=1); feeling anxious (SDTRWITHD7ED=1); having seizures or fits.<sup>7</sup>

#### D.7.10 PRESCRIPTION STIMULANTS

To be classified with prescription stimulant use disorder, IRPYUD5STM, a respondent must have met two or more of the following prescription stimulant criteria in the past year. More specifically, respondents with two or three criteria are considered to have "mild" disorder (IRPYSEV5STM=1); respondents with four or five criteria are considered to have "moderate" disorder (IRPYSEV5STM=2); and respondents with six or more criteria are considered to have "severe" disorder (IRPYSEV5STM=3).

- (1) Used stimulants more often than intended or was unable to keep set limits on tranquilizer use (STIMKPLMT=2)
- (2) Inability to cut down or stop using stimulants every time tried or wanted to (STIMCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of stimulants (STIMLOTTM=1 or STIMGTOVR=1)
- (4) Had a strong urge to use stimulants (SDSTURGEED=1)
- (5) Serious problems at home, work, or school caused by using stimulants, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(STIMSERPB=1)
- (6) Problems with family or friends probably caused by using stimulants (STIMFMFPB=1) and continued to use stimulants even though you thought using tranquilizers caused these problems (STIMFMCTD=1)
- (7) Stimulant use reduced or eliminated involvement or participation in important activities (STIMLSACT=1)
- (8) Used stimulants regularly and then did something that might have put you in physical danger (STIMPDANG=1)
- (9) Continued to use stimulants even though they were causing problems with emotions, nerves, mental health, or physical problems (STIMEMCTD=1 or STIMPHCTD=1)
- (10) Needed to use stimulants more than before to get desired effects or noticed that same amount of stimulant use had less effect than before (STIMNDMOR=1 or STIMLSEFT=1)
- (11) Reported feeling blue or down when trying to stop or cut down using methamphetamine (STIMFLBLU=1) as well experiencing two or more stimulant withdrawal symptoms after stopped use was cut back or stopped. Symptoms include
  - (i) sweating or feeling that your heart was beating fast;
  - (ii) having your hands tremble;
  - (iii) having trouble sleeping;
  - (iv) vomiting or having an upset stomach;
  - (v) seeing,

---

<sup>7</sup> The corresponding variable for having seizures or fits was removed from the file to minimize disclosure risk.

hearing, or feeling things that weren't really there; (vi) feeling like you couldn't sit still; feeling anxious; having seizures or fits (STIMWD2SX=1).

#### D.7.11 PRESCRIPTION SEDATIVES

To be classified with prescription sedative use disorder, IRPYUD5SED, a respondent must have met two or more of the following prescription sedative criteria in the past year. More specifically, respondents with two or three criteria are considered to have "mild" disorder; respondents with four or five criteria are considered to have "moderate" disorder; and respondents with six or more criteria are considered to have "severe" disorder.<sup>8</sup>

- (1) Used sedatives more often than intended or was unable to keep set limits on sedative use (SEDVKPLMT=2)
- (2) Inability to cut down or stop using sedatives every time tried or wanted to (SEDVVCUTEV=2)
- (3) Spent a great deal of time over a period of a month or more getting, using, or getting over the effects of sedatives (SEDVLOTTM=1 or SEDVGTOVR=1)
- (4) Had a strong urge to use sedatives (SDSVURGEED=1)
- (5) Serious problems at home, work, or school caused by using sedatives, such as
  - neglecting their children
  - missing work or school
  - doing a poor job at work or school
  - losing a job or dropping out of school(SEDVSERPB=1)
- (6) Problems with family or friends probably caused by using sedatives (SEDVFMFPB=1) and continued to use sedatives even though you thought using sedatives caused these problems (SEDVFMCTD=1)
- (7) Sedative use reduced or eliminated involvement or participation in important activities (SEDVLSACT=1)
- (8) Used sedatives regularly and then did something that might have put you in physical danger (SEDVPDANG=1)
- (9) Continued to use sedatives even though they were causing problems with emotions, nerves, mental health, or physical problems (SEDVEMCTD=1 or SEDVPHCTD=1)
- (10) Needed to use sedatives more than before to get desired effects or noticed that same amount of sedative use had less effect than before (SEDVNDMOR=1 or SEDVLSEFX=1)
- (11) Reported experiencing two or more sedative withdrawal symptoms after sedative use was cut back or stopped. Symptoms include (i) sweating or feeling that heart was beating fast; (ii) having hands tremble; (iii) having trouble sleeping or sleeping more than normal; (iv) vomiting or feeling nauseous; (v) seeing, hearing, or feeling things that were not really there; (vi) feeling like could not sit still; (vii) feeling anxious; and (viii) having seizures or fits. (SEDVWD1SX=1).

---

<sup>8</sup> See footnote 5.

## **D.8 Summary Measures of DSM-5 SUD**

The following summary indicators of overall SUD (i.e., disorder, no disorder) based on DSM-5 criteria were created using combinations of the recodes described above. In addition to the summary recodes listed below, use disorder measures are available for composite recodes that are described in the Changes over Time section. These include opioids, tranquilizers or sedatives, and CNS stimulants.

### **D.8.1 ILLICIT DRUGS**

To be classified with illicit drug disorder using the DSM-5 definition, UDYR5ILL, a respondent must have been classified as having a disorder of at least one of the following substances: marijuana (IRPYUD5MRJ), hallucinogens (IRPYUD5HAL), inhalants (IRPYUD5INH), methamphetamine (IRPYUD5MTH), cocaine (IRPYUD5COC), heroin (IRPYUD5HER), prescription pain relievers (IRPYUD5PNR), prescription sedatives (IRPYUD5SED), prescription stimulants (IRPYUD5STM), or prescription tranquilizers (IRPYUD5TRQ).

### **D.8.2 ILLICIT DRUGS OTHER THAN MARIJUANA**

To be classified with illicit drug other than marijuana disorder using the DSM-5 definition, UDYR5IEM, a respondent must have been classified as having a disorder of at least one of the following substances: hallucinogens (IRPYUD5HAL), inhalants (IRPYUD5INH), methamphetamine (IRPYUD5MTH), cocaine (IRPYUD5COC), heroin (IRPYUD5HER), prescription pain relievers (IRPYUD5PNR), prescription sedatives (IRPYUD5SED), prescription stimulants (IRPYUD5STM), or prescription tranquilizers (IRPYUD5TRQ).

### **D.8.3 ILLICIT DRUGS OR ALCOHOL**

To be classified with illicit drug or alcohol disorder using the DSM-5 definition, UDYR5ILAL, a respondent must have been classified as having a disorder using the DSM-5 definition of either illicit drugs (UDYR5ILL) or alcohol (IRPYUD5ALC).

### **D.8.4 PRESCRIPTION PSYCHOTHERAPEUTICS**

To be classified with prescription psychotherapeutics disorder, IRPYUD5PSY, a respondent must have been classified as dependent on at least one of the following: prescription pain relievers (IRPYUD5PNR), prescription sedatives (IRPYUD5SED), prescription stimulants (IRPYUD5STM), or prescription tranquilizers (IRPYUD5TRQ).

## **Appendix E**

### **Recoded Mental Health**

## **E.1 Introduction**

The 2020 National Survey on Drug Use and Health (NSDUH) included a “mental health” section of the questionnaire that was designed to provide data on various mental health measures for adults aged 18 or older, such as serious psychological distress (SPD), mental illness (i.e., any mental illness [AMI], serious mental illness [SMI], moderate mental illness [MMI], serious or moderate mental illness [SMMI], low [i.e., mild] mental illness [LMI], and low or moderate mental illness [AMI excluding SMI; LMMI]), suicidal ideation and behavior (i.e., thoughts, plans, and attempts). The 2020 NSDUH also included mental health service utilization sections for adults aged 18 or older and for youths aged 12 to 17, respectively. The mental health utilization sections were designed to provide data on mental health services. Several key questionnaire changes were made to these sections starting in Quarter 4 of 2020. For the mental health section, these changes were limited to the adult suicidal ideation and behavior questions and did not affect the adult SPD and mental illness questions. For the mental health utilization sections, new youth suicidal ideation and behavior questions were added to the youth mental health utilization section. New questions to measure use of virtual (telehealth) services for mental health care were also added to the mental health utilization sections for adults and youths, respectively.

Estimates of past year and past month SPD, past year mental illness, past year suicidal ideation and behavior including past year suicidal ideation and behavior because of coronavirus disease 2019 (COVID-19),<sup>1</sup> and past year use of virtual (telehealth) mental health services are presented in the 2020 detailed tables (Center for Behavioral Health Statistics and Quality [CBHSQ], 2021a).<sup>2</sup> These measures, except SPD, also are presented in the key substance use and mental health indicators in the United States report (Substance Abuse and Mental Health Services Administration [SAMHSA], 2021).<sup>3</sup>

This appendix includes details on the suicidal ideation and behavior, SPD, and mental illness variables. Guidance regarding analysis of these variables, including weighting and variance estimation information, is also provided in this appendix. The Key Mental Health Variables codebook appendix provides tables with the variable names for the most commonly used NSDUH mental health measures as well as information regarding comparability across survey years.<sup>4</sup>

## **E.2 Impact of COVID-19 on the 2020 NSDUH**

The COVID-19 pandemic made 2020 a unique year within the history of NSDUH. Quarter 1 (January to March 2020) was completed using standard NSDUH protocols with in-person data collection. However, Quarter 1 data collection ended 15 days early when work

---

<sup>1</sup> Due to low statistical precision, estimates are not presented for suicidal thoughts and behaviors because of the COVID-19 pandemic among youths.

<sup>2</sup> Starting with the 2015 NSDUH, the mental health detailed tables were combined with the main detailed tables and are now published as the “detailed tables.” Mental health detailed tables were published separately for the 2009–2014 NSDUHs.

<sup>3</sup> This report is considered a first findings report and replaces the national findings and mental health findings reports that were published in 2014 and prior years.

<sup>4</sup> Caution is advised when comparing 2020 to prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details (CBHSQ, 2021b).

was suspended on March 16, 2020. Except for a very brief data collection effort that tested increased safety measures in July, no data were collected in Quarters 2 and 3 (i.e., April to September). For weighting, imputation, and estimation, the small number of Quarter 3 (i.e., July data) interviews were grouped with the Quarter 4 data. Data collection resumed in Quarter 4 but used in-person and web-based procedures. For simplicity, references of Quarter 4 in the 2020 detailed tables (CBHSQ, 2021a), refers to the combined Quarters 3 and 4 data. SAMHSA decided to produce estimates for 2020 using the combined data to increase the sample sizes and resulting precision of the estimates.

For the mental health questions where the content did not change between Quarters 1 and 4, no changes were needed for the mental health variable specifications because the questions in 2020 were equivalent to those in 2019. For the adult suicide behavior questions where the skip logic was changed in Quarter 4 of 2020, changes in the variable specifications were needed to allow Quarters 1 and 4 to be combined. In summary, an adjustment was applied to the Quarter 4 data so that handling of the data was consistent between Quarters 1 and 4. See the section on Suicidal Ideation and Behavior Measures below for more details. Estimates for most mental health measures including adult suicidal ideation and behavior in the 2020 detailed tables have been calculated using data from combined Quarters 1 and 4 of 2020. To protect respondents' confidentiality, the variable QUARTER was removed from the file so that no quarterly analyses can be generated. Given the differences in data collection periods and other methodological procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from prior years in the 2020 detailed tables and first findings report (SAMHSA, 2021). Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years. Caution should also be used when attempting to distinguish the effects on estimates due to true changes in the population<sup>5</sup> (e.g., COVID-19, other events) from the effects due to methodological changes. Regardless, general information on how to compare, combine, and weight the adult mental health data across survey years, including 2020, is provided in this appendix. Caveats regarding the 2020 data are also provided where applicable. See Chapters 2, 3, and 6 of the 2020 methodological summary and definitions for details (CBHSQ, 2021b).

Estimates in the 2020 detailed tables (CBHSQ, 2021a) for new measures added to the mental health sections of the questionnaire in Quarter 4 of 2020 (i.e., adult suicidal ideation and behavior because of COVID-19, youth suicidal ideation and behavior,<sup>6</sup> and use of virtual mental health services among youths or adults) have been calculated using data from Quarter 4 of 2020. Data from any new mental health questions only asked in Quarter 4 or COVID-19 related questions including past year use of virtual (telehealth) mental health services are excluded from the file to minimize disclosure risk.

### E.3 Suicidal Thoughts and Behavior among Adults

In the mental health section of the 2020 NSDUH questionnaire, adult respondents aged 18 or older were asked questions about suicidal thoughts and behaviors. In all quarters of 2020,

---

<sup>5</sup> A true change in a population survey estimate across years is a change that is not plausibly explained by changes in survey data collection methods between those years.

<sup>6</sup> See footnote 1.

adult respondents were asked whether they had suicidal thoughts in the past 12 months. The questions are included below.

**SUI01** [IF AGE=18 OR OLDER] The next few questions are about thoughts of suicide. **At any time in the past 12 months**, that is from **[DATEFILL]** up to and including today, did you **seriously think about trying to kill yourself?**

Before Quarter 4 of 2020, only those adult respondents who reported that they had serious thoughts of suicide in the past 12 months were asked whether they made a suicide plan or tried to kill themselves. The questions asked before Quarter 4 of 2020 are included below.

**SUI02** [IF SUI01=1] During the past 12 months, did you make any plans to kill yourself?

**SUI03** [IF SUI01=1] During the past 12 months, did you **try** to kill yourself?

Beginning in Quarter 4 of 2020, changes were made in the skip logic for the made suicide plans and attempted suicide questions; thus, all adults aged 18 or older were asked these questions regardless of what they reported for serious thoughts of suicide. The questions asked in Quarter 4 of 2020 are included below. This revised skip logic will also be used in the 2021 NSDUH.

**SUI02** [IF AGE=18 OR OLDER] During the past 12 months, did you make any plans to kill yourself?

**SUI03** [IF AGE=18 OR OLDER] During the past 12 months, did you **try** to kill yourself?

In all quarters of 2020, respondents who reported that they attempted suicide in the past 12 months were asked whether they received medical attention from a doctor or other health professional for their suicide attempt. If respondents reported receiving medical attention, they were asked whether they stayed overnight or longer in a hospital for their suicide attempt. These questions are included below.

**SUI04** [IF SUI03=1] During the past 12 months, did you get medical attention from a doctor or other health professional as a result of an attempt to kill yourself?

**SUI05** [IF SUI04=1] Did you stay in a hospital overnight or longer because you tried to kill yourself?

The recoded adult suicide variables in [Table E.1](#) contain data from combined Quarters 1 and 4 of 2020, where the Quarter 4 data were adjusted to be consistent with the Quarter 1 data. The text immediately following [Table E.1](#) provides details on how the Quarter 4 data were adjusted. The combined Quarters 1 and 4 of 2020 recoded variables were used to generate estimates for adult suicidal ideation and behavior in the 2020 detailed tables (CBHSQ, 2021a). The recoded adult suicide variables in [Table E.1](#) are defined as “yes,” “no,” or SAS® missing. See the codebook documentation for more details on how the recoded variables in [Table E.1](#) are created. Only variables that seemed to have low disclosure risk have been retained on the 2020 PUF.

**Table E.1 Adult Suicidal Thoughts and Behavior Recoded Variable Names: NSDUH 2020**

Recoded Variable Name	Variable Label
MHSUITHK	RC-ADULT SERIOUSLY THOUGHT ABOUT KILLING SELF IN PAST YEAR
MHSUIPLN	RC-ADULT MADE PLANS TO KILL SELF IN PAST YEAR
MHSUITRY	RC-ADULT ATTEMPTED TO KILL SELF IN PAST YEAR
MHSUIMED <sup>1</sup>	RC-RCVD MEDICAL ATTENTION FOR ATTEMPT SUIC IN PAST YR
MHSUIHOS <sup>1</sup>	RC-STAY OVERNIGHT AT HOSP FOR ATTEMPT SUIC IN PAST YR

NOTE: For 2020, these variable names are the same as similarly defined variables in prior years. Due to the methodological changes for 2020, caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years because the comparability of the data is unknown. See Chapter 6 of the 2020 *National Survey on Drug Use and Health (NSDUH): Methodological Summary and Definitions* for details (CBHSQ, 2021b).

<sup>1</sup>This variable is excluded from the public use file to minimize disclosure risk.

Very few adult respondents in Quarter 4 reported that they did not have serious thoughts of suicide but they made suicide plans or attempted suicide. Therefore, to have consistently defined recoded variables for suicide plans and suicide attempts based on the full year of 2020 data from Quarters 1 and 4, the Quarter 4 data were adjusted to match the prior years' skip patterns. Any respondents in Quarter 4 who reported having no serious thoughts of suicide in the past 12 months were treated in the recoded variables as not making suicide plans or attempting suicide in that period, even if they indicated they did make suicide plans or attempt suicide.

This issue of the changed skip logic in Quarter 4 also applied to recoded variables for the receipt of medical attention because of suicide attempts and hospitalization because of suicide attempts that were based on the full year of 2020 data from Quarters 1 and 4. The Quarter 4 data were handled so that the skip logic was consistent with how the data in Quarter 1 and prior years were handled. But this data has been excluded from the 2020 PUF due to disclosure risk.

#### **E.4 Analysis Weight and Variance Estimation Variables for Suicidal Thoughts and Behavior Measures**

For the 2020 NSDUH, the weighting process was modified to account for the disruption in data collection because of COVID-19 and the subsequent introduction of multimode data collection (in person and web) for NSDUH in Quarter 4. See Section 2.3.4.2 of the 2020 methodological summary and definitions (CBHSQ, 2021b) for details on the modifications. One of the modifications had to do with the number of adult web respondents in Quarter 4 who provided usable information on their substance use but did not complete the mental health or later sections (i.e., “break-offs”), which raised concerns about the 2020 mental health estimates for adults and potential bias.<sup>2</sup> To overcome the bias issue, additional analysis weights (“break-off analysis weights”) were created to analyze unimputed outcome variables beginning with the mental health section of the questionnaire for adults and including subsequent sections. The 2020 adult suicidal thoughts and behavior measures in [Table E.1](#) were used in the 2020 detailed tables (CBHSQ, 2021a) and 2020 first findings report (SAMHSA, 2021). Estimates for these measures were created by using the combined Quarters 1 and 4 data and the break-off analysis weight. Due to potential disclosure risk, the break-off analysis weight was removed from the 2020 public use file (PUF). Therefore, all adult suicidal thoughts and behavior measures analyzed using the 2020

<sup>2</sup> See footnote 1.

PUF should use the standard analysis weight (ANAWLTQ1Q4\_C) and the variance estimation variables for Quarters 1 and 4 (VESTRQ1Q4\_C and VEREP). Because of this, caution should be used when analyzing these outcomes and drawing conclusions using the PUF analysis weights. See Section 2.3.4 of the 2020 methodological summary and definitions for more details on the break-off analysis weight used in the 2020 detailed tables and the first findings report.

Analyses for suicidal ideation and behavior among adults across all years 2008 and later would be analyzed using the standard analysis weight (ANALWT\_C) for 2008 to 2019 and the standard analysis weight (ANALWTQ1Q4\_C) for 2020. Users should also create a new variance estimation stratum variable that takes on the value of VESTR for 2008-2019 respondents and the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2008 to 2020.

If combining 2020 with prior years of NSDUH data for adult suicidal ideation and behavior variables, the 2020 person-level analysis weight variable names and variance estimation variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. See the Special Types of Analyses section of the codebook introduction for more details. Users should consider the differences in methodology prior to making any decisions on whether or how to use these data across all years.

## **E.5 Mental Illness Measures**

Past year mental illness estimates for 2008 through 2011 found in tables and reports published prior to the 2012 NSDUH were based on a prediction model for mental illness developed using the 2008 data from the Mental Health Surveillance Study (MHSS) (referred to as the “2008 model”). This model was developed using approximately 750 cases obtained from a clinical follow-up study. Although SAMHSA continued to obtain clinical interviews after 2008, estimates of SMI and AMI from the 2009, 2010, and 2011 NSDUHs were based on the model developed from the 2008 clinical assessment sample. The same model was applied to each year’s NSDUH data to provide consistency in SMI and AMI comparisons across the years. Producing a new model each year based on the small annual clinical samples (only 500 interviews in 2009 and 2010) would have resulted in large changes in the model parameters and corresponding prevalence rates due to sampling error, making it impossible to detect real trends in SMI and AMI over time. Furthermore, an evaluation of the 2008 model, using the 2009 NSDUH clinical data, found that the model could not be significantly improved with the additional 500-case 2009 clinical sample. The clinical follow-up study, started in 2008, continued until 2012, leading to a nationally representative sample of approximately 5,000 cases that were used to develop an improved mental illness prediction model (referred to as the “2012 model”). This revised and improved model was used to predict mental illness starting with the 2012 NSDUH.

Unfortunately, the 2012 model could not be applied to the 2007 and earlier NSDUH data because some of the predictors in the 2012 model were not collected before 2008. However, the 2005-2007 NSDUHs did collect some of the necessary predictors, along with other mental health variables that could potentially be good predictors of SMI and AMI. Given the analytic benefits of having comparable indicators of SMI for additional years of NSDUH data, alternative models were developed from the MHSS data in an attempt to be comparable with mental illness data for

2008 and later<sup>8</sup> years (CBHSQ, 2017a). Users should consider the difference in methodology prior to making any decisions on whether and how to use the 2005-2007 measures.

For the 2012-2014 mental health detailed tables (CBHSQ, 2013, 2014c, 2015) and the 2015-2020 detailed tables (CBHSQ, 2016, 2017b, 2018, 2019, 2020, 2021a), estimates, including those from 2008 through 2011, were all based on the 2012 revised model. The mental illness estimates in the 2008 detailed tables (Office of Applied Studies, 2009) and the 2009-2011 mental health detailed tables (CBHSQ, 2010a, 2012a, 2012b) were updated using the revised 2012 model. For more information on the MHSS and the mental illness indicators, see the Development of Mental Illness Indicators section below.

Provided below are details about the psychological distress and functional impairment scales used to measure mental illness and the development of the 2008-2020 mental illness indicators based on the 2012 model. Details about the 2008-2011 mental illness indicators based on the 2008 model and the alternative model for the 2005-2007 measures are also provided. Additionally, information about the availability of the mental illness variables as well as guidance regarding analysis of these variables, including weighting and variance estimation information, is provided.

## **E.5.1 NSDUH Scales Used to Measure Mental Illness**

### **E.5.1.1 Psychological Distress Scale: K6**

The K6 screening instrument for nonspecific psychological distress (Furukawa et al., 2003; Kessler et al., 2003) included in the computer-assisted interviewing instrument was used to create both past month (SPDMON) and past year (SPDYR) SPD indicators.<sup>9</sup> For both of the time periods, respondents were classified with SPD if a score based on these K6 measures was 13 or greater.

The two six-item K6 scales gather information regarding how frequently a respondent experienced symptoms of psychological distress during the past 30 days and during a month in the past 12 months when he or she felt more depressed, anxious, or emotionally stressed than in the past 30 days, respectively. Only respondents who indicated that there was a worse month than the past 30 days (DSTWORST=1) were asked about the worst month in the past year other than the past 30 days.

The questions comprising the two K6 scales and the screener question for the worst month scale are provided below with their associated edited variable names from the mental health section as well as the response categories for each question:

---

<sup>8</sup> See footnote 4.

<sup>9</sup> Because of the addition of the 30-day K6 questions in the 2008 NSDUH, past year K6 and SPD variables in 2008 and subsequent years are not comparable with past year K6 and SPD variables from previous years and therefore have been renamed.

**DSTNRV30** During the past 30 days, how often did you feel nervous?

- 1 All of the time
  - 2 Most of the time
  - 3 Some of the time
  - 4 A little of the time
  - 5 None of the time
- Don't Know (DK)/Refused (REF)

*Response categories are the same for the remaining past month K6 questions:*

**DSTHOP30** During the past 30 days, how often did you feel hopeless?

**DSTRST30** During the past 30 days, how often did you feel restless or fidgety?

**DSTCHR30** During the past 30 days, how often did you feel so sad or depressed that nothing could cheer you up?

**DSTEFF30** During the past 30 days, how often did you feel that everything was an effort?

**DSTNGD30** During the past 30 days, how often did you feel down on yourself, no good, or worthless?

**DSTWORST** The last questions asked about how you have been feeling during the past 30 days. Now think about **the past 12 months**. Was there a month in the past 12 months when you felt more depressed, anxious, or emotionally stressed than you felt during the past 30 days?

- 1 Yes
- 2 No

**DSTNRV12** Think of one month in the past 12 months when you were the most depressed, anxious, or emotionally stressed.

During that month, how often did you feel nervous?

- 1 All of the time
  - 2 Most of the time
  - 3 Some of the time
  - 4 A little of the time
  - 5 None of the time
- DK/REF

*Response categories are the same for the remaining worst month K6 questions:*

- DSTHOP12** During that same month when you were at your worst emotionally . . . how often did you feel hopeless?
- DSTRST12** During that same month when you were at your worst emotionally . . . how often did you feel restless or fidgety?
- DSTCHR12** During that same month when you were at your worst emotionally . . . how often did you feel so sad or depressed that nothing could cheer you up?
- DSTEFF12** During that same month when you were at your worst emotionally . . . how often did you feel that everything was an effort?
- DSTNGD12** During that same month when you were at your worst emotionally . . . how often did you feel down on yourself, no good, or worthless?

Each K6 scale item shown above was transformed so that “All of the time” was coded 4, “Most of the time” was coded 3, “Some of the time” was coded 2, “A little of the time” was coded 1, and “None of the time” was coded 0, along with responses matching “Don’t know,” refusals, bad data, blanks, and legitimate skips.

A past month distress score (K6SCMON) was calculated by summing these transformed values across the six past 30-day variables (DSTNRV30, DSTHOP30, DSTRST30, DSTCHR30, DSTEFF30, and DSTNGD30) to arrive at a value ranging between 0 and 24. Likewise, a worst month in the past year distress score (K6SCYR) was calculated by summing the transformed values across the six worst month in the past year variables (DSTNRV12, DSTHOP12, DSTRST12, DSTCHR12, DSTEFF12, and DSTNGD12) to arrive at a value ranging between 0 and 24. The worst month in the past year distress score (K6SCYR) has values only for adult respondents who indicated that there was a month in the past year that was worse than the past 30 days (DSTWORST=1). A worst total score (K6SCMAX) was then created that takes on the maximum value of the past month distress score (K6SCMON) and the worst month in the past year distress score (K6SCYR) in order to represent the worst distress score during the past year, regardless of whether this contradicts the response to DSTWORST. For all the K6 score and SPD variables, youths aged 12 to 17 were assigned the standard system missing code (.) because the mental health section was not administered to youths.

An alternative worst month in the past year total score variable (WSPDSC2) was created to indicate the worst distress score during the past year. Using the worst month total score (K6SCMAX), the alternative worst month total score (WSPDSC2) is coded 0 when K6SCMAX has a value from 0 to 7, and WSPDSC2 is assigned a value of 1 to 17 when K6SCMAX has a corresponding value of 8 to 24. This variable was not used in the creation of past month and past year SPD variables but was used in both the 2008 and 2012 models to create the mental illness variables discussed later in this document. The decision to create a recoded version of the past month K6 score was based on an analysis of the 2008 MHSS. Specifically, the alternative past year K6 score (WSPDSC2) was used in the models because the SMI prevalence was typically extremely low for respondents with worst month in the past year K6 scores of less than 8, and

the prevalence rates started increasing only once scores were 8 or greater. For more details about how this recoded score was created as well as more details on the original score, see Aldworth et al. (2009).

Using the past month distress score defined above, adults aged 18 or older are classified as having past month SPD (SPDMON=1) if their distress score is 13 or greater ( $K6SCMON \geq 13$ ), and they are classified as not having past month SPD (SPDMON=0) if their distress score is less than 13 ( $K6SCMON < 13$ ). This cutoff point was chosen because it has been shown to be highly correlated with SMI (Colpe et al., 2009) and is the standard cutoff point used by other surveys. Likewise, past year SPD (SPDYR) is defined the same way as past month SPD by using the total past year score (K6SCMAX) and the same cutoff value of 13.

The use of the two reference periods to create the total past year score (K6SCMAX) that defines past year SPD (SPDYR) started with the 2008 NSDUH. From 2005 to 2007, respondents were asked only about distress in the month when they were the most depressed, anxious, or emotionally distressed in the past year. Because of this change, past year K6 and SPD estimates from years prior to 2008 were no longer comparable with estimates from 2008 onward. To address this comparability issue, an adjusted version of the worst total K6 score (K6SMXADJ) and past year SPD (SPDYRADJ) variables were created retroactively for survey years 2005 through 2007. These variables were statistically adjusted to make the 2005-2007 K6 and SPD estimates comparable with the 2008 and subsequent K6 and SPD estimates.<sup>10</sup> The 2005-2007 adjusted variables (K6SMXADJ and SPDYRADJ) can be renamed for use in analyses to match the 2008 and subsequent variable names (K6SCMAX and SPDYR) to produce comparable estimates across all years<sup>11</sup> (2005 and subsequent years), as seen in the 2020 detailed tables (CBHSQ, 2021a). More information about how the statistically adjusted K6 and SPD variables were created can be found in the 2005-2007 codebooks and in the report describing these adjustments (Aldworth et al., 2012).

### E.5.1.2 Functional Impairment Scale: WHODAS

The World Health Organization Disability Assessment Schedule (WHODAS) is a scale used to measure functional impairment that consists of a series of items that are used for assessing disturbances in social adjustment and behavior (i.e., functional impairment). A reduced set of 13 WHODAS items (Novak et al., 2010; Rehm et al., 1999) are included in the NSDUH. Responses to this impairment scale were used to create eight variables that were transformed and summed to define the WHODAS total score used in the development of both the 2008 and 2012 SMI prediction models. The questions comprising the abbreviated WHODAS are provided below, with their associated edited variable names from the mental health section as well as the response categories for each question:

The next questions are about how much your emotions, nerves, or mental health caused you to have **difficulties in daily activities**.

---

<sup>10</sup> See footnote 4.

<sup>11</sup> See footnote 4.

In answering, think of the **one month** in the past 12 months when your emotions, nerves, or mental health interfered **most** with your daily activities.

**IMPREMEM** During that one month when your emotions, nerves or mental health interfered **most** with your daily activities . . .

how much difficulty did you have **remembering to do things you needed to do?**

- 1 No difficulty
- 2 Mild difficulty
- 3 Moderate difficulty
- 4 Severe difficulty

DK/REF

**IMPCONCN** how much difficulty did you have **concentrating on doing something important when other things were going on around you?**

- 1 No difficulty
- 2 Mild difficulty
- 3 Moderate difficulty
- 4 Severe difficulty

DK/REF

**IMPGOUT** how much difficulty did you have **going out of the house and getting around on your own?**

- 1 No difficulty
- 2 Mild difficulty
- 3 Moderate difficulty
- 4 Severe difficulty
- 5 You didn't leave the house on your own

DK/REF

**IMPGOUTM** [IF IMPGOUT = 5] Did problems with your emotions, nerves, or mental health keep you from leaving the house on your own?

- 1 Yes
- 2 No

DK/REF

**IMPPEOP** how much difficulty did you have **dealing with people you did not know well?**

- 1 No difficulty
- 2 Mild difficulty
- 3 Moderate difficulty
- 4 Severe difficulty

5 You didn't deal with people you did not know well  
DK/REF

**IMPPEOPM** [IF IMPPEOP = 5] Did problems with your emotions, nerves, or mental health keep you from dealing with people you did not know well?

- 1 Yes
  - 2 No
- DK/REF

**IMPSOC** how much difficulty did you have **participating in social activities, like visiting friends or going to parties?**

- 1 No difficulty
  - 2 Mild difficulty
  - 3 Moderate difficulty
  - 4 Severe difficulty
  - 5 You didn't participate in social activities
- DK/REF

**IMPSOCM** [IF IMPSOC=5] Did problems with your emotions, nerves, or mental health keep you from participating in social activities?

- 1 Yes
  - 2 No
- DK/REF

**IMPHHLD** how much difficulty did you have **taking care of household responsibilities?**

- 1 No difficulty
  - 2 Mild difficulty
  - 3 Moderate difficulty
  - 4 Severe difficulty
  - 5 You didn't take care of household responsibilities
- DK/REF

**IMPHHLDM** [IF IMPHHLD=5] Did problems with your emotions, nerves, or mental health keep you from taking care of household responsibilities?

- 1 Yes
  - 2 No
- DK/REF

**IMPRESP** how much difficulty did you have **taking care of your daily responsibilities at work or school?**

- 1 No difficulty
  - 2 Mild difficulty
  - 3 Moderate difficulty
  - 4 Severe difficulty
  - 5 You didn't work or go to school
- DK/REF

**IMPRESPM** [IF IMPRESP=5] Did problems with your emotions, nerves, or mental health keep you from working or going to school?

- 1 Yes
  - 2 No
- DK/REF

**IMPWORK** [IF IMPRESP NE 5] During that one month when your emotions, nerves or mental health interfered **most** with your daily activities . . .

how much difficulty did you have **getting your daily work done as quickly as needed?**

- 1 No difficulty
  - 2 Mild difficulty
  - 3 Moderate difficulty
  - 4 Severe difficulty
- DK/REF

An original WHODAS total score (WHODASC2) was created to indicate the level of difficulty in performing daily activities due to problems with emotions, nerves, or mental health. Each of the eight variables created from the WHODAS items shown above was transformed into values of 0 to 3 so that a response of "Severe difficulty" was coded 3, "Moderate difficulty" was coded 2, and "Mild difficulty" was coded 1. Values of "No difficulty" were coded 0, along with nonresponses (i.e., for responses of "No," "Don't know," or "Refused"). Some items had a fifth category to deal with "Not applicable" responses. For example, the question about difficulties regarding taking care of daily responsibilities at work or school (IMPRESP) had a fifth category, "You didn't work or go to school." If this category was selected, then another question was asked as to whether respondents' emotions, nerves, or mental health caused them to be unable to work or go to school (IMPRESPM). A "Yes" response to the follow-up question (IMPRESPM=1) was coded 3 and a "No" response (IMPRESPM=2) was coded 0. One exception to this coding was the last WHODAS recode on how much difficulty the respondents had in getting their daily work done as quickly as needed (IMPWORK). This item was asked of the respondents only if in the previous question they responded that they worked or went to school (IMPRESP=1 to 4). In the case that they responded that they did not work or go to school (IMPRESP=5), their response to the follow-up question referred to above (IMPRESPM) determined the final item score for IMPWORK; otherwise, IMPWORK was recoded similar to the other items.

The transformed scale values were summed across the eight variables created from the WHODAS items (remembering, concentrating, going out of the house on your own, dealing with people you don't know well, participating in social activities, taking care of household responsibilities, taking care of daily work/school responsibilities, and getting your daily work done as quickly as needed) to arrive at a value ranging between 0 and 24. For both the WHODAS total scores, youths aged 12 to 17 were assigned the standard system missing code (.) because the mental health section was not administered to youths.

An alternative WHODAS total score (WHODASC3) was created to indicate the number of daily activities in which a respondent had moderate or severe difficulty performing or did not perform due to problems with emotions, nerves, or mental health. Each of the eight variables created from WHODAS items shown above was transformed into values of 0 or 1 so that responses indicating "Moderate difficulty" or "Severe difficulty" were coded 1 and responses indicating "Mild difficulty" or "No difficulty" were coded 0. If a fifth category of "Not applicable" was available and selected (see above for an example of a fifth question), then another question was asked as to whether respondents' emotions, nerves, or mental health caused them to be unable to work or go to school. A "Yes" response was coded 1 and a "No" response was coded 0. The transformed scale values were summed across the eight WHODAS activities to arrive at a value ranging between 0 and 8. This alternative WHODAS total score was used in both the 2008 and 2012 models estimating the mental illness variables. The decision to create a recoded version of the WHODAS total score was based on an analysis of the 2008 MHSS. Use of the recoded version of the WHODAS score (WHODASC3) in the models was driven by the realization that a dichotomous measure dividing severely impaired from less severely impaired respondents fit better than a linear continuous measure. For more details about how this alternative score was created as well as more details on the original score, see Aldworth et al. (2009).

## **E.5.2 Development of Mental Illness Indicators**

The MHSS was initiated in 2008 with the primary goal of producing SMI estimates. Because of constraints on the interview time in the NSDUH and the need for trained mental health clinicians, it was not possible to administer a full structured diagnostic clinical interview to assess mental illness on all 45,000 adult respondents; therefore, the approach adopted by SAMHSA was to utilize short scales separately measuring psychological distress and functional impairment as described above that could be used in a statistical model to accurately predict whether a respondent had mental illness. Models that used these short scales to predict mental illness status have been developed using a subsample of NSDUH respondents who had completed the NSDUH interview and were administered a diagnostic interview (First et al., 2002) via a clinical follow-up study.

In the 2008 NSDUH, the first year of the MHSS, approximately 1,500 NSDUH respondents participated in the clinical follow-up. Half of these respondents (approximately 750) were administered the WHODAS (discussed earlier in the text) and the other half were administered the Sheehan Disability Scale (SDS). This MHSS sample was used to develop a prediction model (the "2008 model") that was initially used to produce estimates of mental illness from the main NSDUH samples for the 2008-2011 NSDUHs. The purpose of the 2008 split sample was to determine whether the SDS or WHODAS impairment scale was a better

predictor of SMI; therefore, for the 2008 NSDUH, two models were used to predict SMI: one for each impairment scale (WHODAS and SDS). The 2008 models for SMI were chosen so that the estimates from the WHODAS and the SDS samples were approximately equal, and hence published estimates of SMI were based on both WHODAS and SDS samples.<sup>12</sup> The WHODAS model was determined to be the better predictor of SMI; therefore, starting with the 2009 NSDUH, only the WHODAS impairment scale was administered in the NSDUH and used for estimating all levels of mental illness (SMI, AMI, LMI, MMI, and SMMI). For further details, see Appendix B, Section B.4.3, in the 2009 mental health findings report (CBHSQ, 2010b).

In 2010, SAMHSA began preliminary investigations to assess whether improvements to the model were warranted using the MHSS clinical data collected since 2008. The 2011 and 2012 MHSS clinical samples were augmented to include 1,500 respondents per year, leading to a combined sample of approximately 5,000 clinical interviews for the MHSS from 2008 to 2012. It was recognized that altering the model for generating estimates would complicate the measurement of changes in SMI and other mental illness estimates across years. For example, if one model was used to produce estimates for the 2008-2011 NSDUH data and a different model was used for the 2012 NSDUH, then it would not be straightforward to determine whether changes in the prevalence of SMI could be attributed to a real underlying change in the population or to changes in the model. Similarly, if the 2012 NSDUH prevalence estimates were based on a new model and not significantly different from NSDUH estimates since 2008, it still could not be concluded that changing the model did not affect estimates. Rather, changes to the model used for the 2012 NSDUH could obscure actual changes in the population and lead to the erroneous conclusion of no changes in prevalence.

Despite these concerns, SAMHSA determined that the 2008 model had some important shortcomings that had not been detected in the original model fitting because of the small number of respondents in the 2008 MHSS. Specifically, the 2008 model substantially overestimated SMI and AMI among young adults relative to the clinical interview data. In addition, improvements were needed to the weighting procedures for the MHSS sample data to better account for nonresponse and undercoverage (i.e., because people with mental illness appeared to be more likely to participate in the follow-up and because only NSDUH respondents who answered their surveys in English were eligible for the clinical follow-up). Therefore, SAMHSA decided to revise the model using the combined 2008-2012 clinical data (the “2012 model”). Consistent with the 2008 model, for the clinical interview respondents who had been administered the SDS in the 2008 NSDUH, an alternative 2012 SMI model was fit using the complete 2008-2012 MHSS dataset (i.e., including both the WHODAS and SDS half samples in 2008). See CBHSQ (2014b) for more details on the 2008-2012 MHSS operations and data collections.

To reduce bias and improve prediction, a recoded age variable and additional mental health-related variables (i.e., serious thoughts of suicide in the past year and having a past year MDE) were added in the 2012 model. The addition of these mental health predictors in the model, however, impacts the types of analyses that can be performed with the mental illness variables derived from the model. See the Using Mental Illness Variables in Analysis section for

---

<sup>12</sup> For 2008, estimates of AMI, SMMI, LMI, and MMI were based only on the WHODAS half sample because notable differences were observed between the WHODAS and the SDS samples.

more details. To eliminate coverage and nonresponse error, alternatives for the weights were applied to the clinical sample data for the model development. To provide consistent data for trend assessment, the mental illness estimates in the 2008 detailed tables (Office of Applied Studies, 2009) and the 2009-2011 mental health detailed tables (CBHSQ, 2010a, 2012a, 2012b) were recomputed using the new 2012 model. For more detailed information on the 2008 MHSS design and analysis, see Colpe et al. (2009), Colpe et al. (2010), and Aldworth et al. (2009). The remainder of this section summarizes the models and the methods that were used to compute estimates of mental illness from the main NSDUH sample.

## E.6 SMI Prediction Model

Both the 2008 and 2012 models are prediction models for mental illness. Each prediction model is a weighted logistic regression. The response variable  $Y$  was defined so that  $Y = 1$  when an SMI diagnosis was positive based on the clinical interview; otherwise,  $Y = 0$ . If  $\mathbf{x}$  is a vector of realized explanatory variables, then the response probability  $\pi = \Pr(Y = 1 | \mathbf{x})$  can be estimated using a weighted logistic regression model. Details about both the 2008 and 2012 prediction models for SMI are included below. For further technical details on the 2012 prediction models as well as the impact of the revised model on the 2008-2011 estimates, see the 2012 MHSS design and estimation report (CBHSQ, 2014a).

### E.6.1 2008 Model

The 2008 model was fit with 761 respondents from the 2008 MHSS, two of whom were subsequently identified as having data errors. The final WHODAS calibration model for the 2008 prediction model for SMI was determined as

$$\text{logit}(\hat{\pi}) = \log[\hat{\pi} / (1 - \hat{\pi})] = -4.74999920 + 0.20977232X_k + 0.38388395X_w,$$

where  $\hat{\pi}$  refers to an estimate of the SMI response probability  $\pi$ ,  $X_k$  represents WSPDSC2, and  $X_w$  represents WHODASC3.

[Table E.2](#) displays the WHODAS model specifications for the 2008 SMI prediction model.

**Table E.2 Final 2008 WHODAS SMI Prediction Model**

Final 2011 Model: WSPDSC2 + WHODASC3						
Term	Beta	Beta SE	T-statistic	P-value	DF	Wald P-value
Intercept	-4.7500	0.3522	-13.4854	0.0000		
WSPDSC2	0.2098	0.0765	2.7439	0.0072	1	0.0072
WHODASC3	0.3839	0.1208	3.1768	0.0020	1	0.0020

DF = degrees of freedom, SE = standard error, SMI = serious mental illness, WHODAS = abbreviated eight-item World Health Organization Disability Assessment Schedule.

The formula for the predicted probability of SMI (SMIPP) using the model parameter estimates in [Table E.2](#) (but expressed with more decimal points) is as follows:

$$\text{SMIPP} = 1/(1 + \exp[-(-4.74999920 + 0.20977232*\text{WSPDSC2} + 0.38388395*\text{WHODASC3})]).$$

In the 2008 SMI prediction model, the respondent is classified as having past year SMI if SMIPP is greater than or equal to 0.269719459516744 (SMI cutoff point).

## E.6.2 2012 Model

The 2012 SMI prediction model was fit with data from 4,912 WHODAS MHSS respondents from 2008 through 2012, excluding the one case from 2008 and the one case from 2009 that were dropped because of data errors. The final WHODAS calibration model for the 2012 prediction model for SMI was determined as

$$\text{logit}(\hat{\pi}) = \log[\hat{\pi} / (1 - \hat{\pi})] = -5.972664 + 0.0873416X_k + 0.3385193X_w + 1.9552664X_s + 1.1267330X_m + 0.1059137X_a$$

In addition to  $X_k$  and  $X_w$ , this model includes the following from the main NSDUH interview data:

- $X_s$  = Serious Thoughts of Suicide in the Past Year (MHSUTK\_U<sup>13</sup>): Coded as 1 if “Yes”; coded as 0 otherwise.
- $X_m$  = Past Year MDE (AMDEY2\_U for WHODAS; AJAMDE\_U for SDS): Coded as 1 if the criteria for past year MDE (major depressive episode) were met;<sup>14</sup> coded as 0 otherwise.
- $X_a$  = Recoded Age (AGE1830<sup>15</sup>): Coded as age minus 18 if aged 18 to 30; coded as 12 otherwise.

[Table E.3](#) displays the WHODAS model specifications for the 2012 SMI prediction model.

**Table E.3 Final 2012 WHODAS SMI Prediction Model**

Final 2012 Model: WSPDSC2 + WHODASC3 + MHSUTK_U + AMDEY2_U + AGE1830						
Term	Beta	Beta SE	T-statistic	P-value	DF	Wald P-value
Intercept	-5.9727	0.3201	-18.6586	0.0000		
WSPDSC2	0.0873	0.0248	3.5247	0.0009	1	0.0009
WHODASC3	0.3385	0.0349	9.7034	0.0000	1	0.0000
MHSUTK_U	1.9553	0.2164	9.0342	0.0000	1	0.0000
AMDEY2_U	1.1267	0.2196	5.1308	0.0000	1	0.0000
AGE1830	0.1059	0.0244	4.3380	0.0001	1	0.0001

DF = degrees of freedom, SE = standard error, SMI = serious mental illness, WHODAS = abbreviated eight-item World Health Organization Disability Assessment Schedule.

<sup>13</sup> The 2020 Quarter 4 skip logic change occurred after the serious thoughts of suicide question; therefore, the change does not impact MHSUTK\_U. See the recoded mental health section of the codebook for more information.

<sup>14</sup> In this situation, the past year MDE measure is from the main NSDUH interview (i.e., not from the Structured Clinical Interview for DSM-IV). See Section 3.4.8 of Chapter 3 from the 2020 NSDUH methodological summary and definitions (CBHSQ, 2021b).

<sup>15</sup> The age variable (AGE1830) is excluded from the file due to disclosure risk.

The formula for the predicted probability of SMI (SMIPP\_U) using the model parameter estimates in [Table E.3](#) (but expressed with more decimal points) is as follows:

$$\text{SMIPP\_U} = 1/(1 + \exp[-(-5.972664 + 0.0873416*\text{WSPDSC2} + 0.3385193*\text{WHODASC3} + 1.9552664*\text{MHSUTK\_U} + 1.1267330*\text{AMDEY2\_U} + 0.1059137*\text{AGE1830})]).$$

In the 2012 SMI WHODAS prediction model, the respondent is classified as having past year SMI if SMIPP\_U is greater than or equal to 0.260573529 (SMI cutoff point).

### **E.6.3 Modified 2012 Model for the 2008 SDS Half Sample**

As described in the Development of Mental Illness Indicators section above, the 2008 NSDUH data included a split sample. Similar to the 2008 model, the revised 2012 model also has an alternative model for the SDS data that was fit with data from the *complete* 2008-2012 MHSS clinical sample that contains 5,653 MHSS respondents, excluding four cases from 2008 (one from the WHODAS half sample and three from the SDS half sample) and one case from 2009 that were dropped because of data errors.

The modified 2012 SMI prediction model for the SDS half sample was determined as

$$\text{logit}(\hat{\pi}) = \log[\hat{\pi} / (1 - \hat{\pi})] = -5.7736246 + 0.1772067X_k + 1.8392433X_s + 1.6428623X_m + 0.1231266X_a$$

[Table E.4](#) displays the SDS half sample model specifications for the 2012 SMI prediction model.

**Table E.4 Final 2012 SDS Half Sample SMI Prediction Model**

Final 2012 Model: WSPDSC2 + MHSUTK_U + AJAMDE_U + AGE1830						
Term	Beta	Beta SE	T-statistic	P-value	DF	Wald P-value
Intercept	-5.7736	0.3479	-16.5960	0.0000		
WSPDSC2	0.1772	0.0190	9.3251	0.0000	1	0.0000
MHSUTK_U	1.8392	0.1941	9.4781	0.0000	1	0.0000
AJAMDE_U	1.6429	0.2119	7.7528	0.0000	1	0.0000
AGE1830	0.1231	0.0259	4.7482	0.0000	1	0.0000

DF = degrees of freedom, SDS = Sheehan Disability Scale, SE = standard error, SMI = serious mental illness.

Although the model was fit across all years and the cutoff points were determined based on all years, these cutoff points were used only for the main survey respondents in the 2008 Sample B to predict SMI, AMI, and SMMI positives. The formula for the predicted probability of SMI (SMIPP\_U) using the model parameter estimates in [Table E.4](#) (but expressed with more decimal points) is as follows:

$$\text{SMIPP\_U} = 1/(1 + \exp[-(-5.7736246 + 0.1772067*\text{WSPDSC2} + 1.8392433*\text{MHSUTK\_U} + 1.6428623*\text{AJAMDE\_U} + 0.1231266*\text{AGE1830})]).$$

In the 2012 SMI SDS half sample prediction model, the respondent is classified as having past year SMI if SMIPP\_U is greater than or equal to 0.236434 (SMI cutoff point).

#### E.6.4 Alternative Model for 2005 to 2007

As described above, estimates of SMI and AMI have been produced each year since 2008 using models developed with 2008-2012 clinical interview data, along with data from the main survey mental health section that has remained in NSDUH. Initially, these models could not be applied to the 2007 and earlier NSDUH data because some of the predictors in the 2008-2012 models were not collected before 2008. However, alternative models were developed from the MHSS data in an attempt to be comparable with the 2008 and later<sup>16</sup> estimates (CBHSQ, 2017a).

Because the aim was to provide alternative measures of SMI and AMI that matched those derived from the 2012 model (SMIYR\_U/AMIYR\_U), the 2012 model-based past year mental illness (SMIYR\_U/AMIYR\_U) variable(s) was designated as the *response variable(s)* in the alternative models. Therefore, the entire adult NSDUH data from 2008A<sup>17</sup> to 2012 was available for the development of these models. Candidate *predictor variables* were created from information contained in common in all NSDUHs from 2005 to 2012. A set of suitable predictor variables meeting this requirement was identified, and subsets of these variables were selected to formulate alternative final SMI and AMI prediction models. The final models were selected based on how well the associated cutoff point estimators performed in terms of the total error rate in the receiver operating characteristic analysis and in terms of bias at the overall and domain (i.e., subpopulation) levels.

Unfortunately, even the final selected alternative AMI prediction model exhibited a fairly high total error rate and levels of bias statistically, significantly different from zero at the .05 level for a large number of domains. Therefore, a decision was made not to proceed with creating measures of AMI for 2005 to 2007 based on the final alternative AMI prediction model.

However, the final selected alternative SMI prediction model exhibited a very low level of bias and a low total error rate overall. In addition, very few domains exhibited levels of bias significant at the .05 level. Therefore, a decision was made to proceed with creating measures of SMI for 2005 to 2007 based on the final alternative SMI prediction model.

The following variable SMIPP\_A represents the predicted probability that a respondent has SMI based on the final alternative SMI prediction (logistic regression) model for 2005 to 2007:

$$\begin{aligned} \text{SMIPP\_A} = & 1 / (1 + \exp [ -(-8.481558862 + 0.344567199 * \text{WSPDSC2\_A} \\ & + 2.131295774 * \text{AMDEYR\_A} + 0.172135081 * \text{AGE1830} \\ & + 0.507779212 * \text{ADSDSSC3\_A} + 1.694191582 * \text{ADWRSTHK\_A} \\ & + 0.772597986 * \text{DEPRSYR\_A})]). \end{aligned}$$

---

<sup>16</sup> See footnote 4.

<sup>17</sup> The 2008A NSDUH refers to Sample A of the 2008 NSDUH (i.e., the half sample assigned to the WHODAS questions in 2008).

In the 2005-2007 alternative prediction model, the respondent is classified as having past year SMI if SMIPP\_A is greater than or equal to 0.372556455 (SMI cutoff point). Users should consider the differences in methodology prior to making any decisions on whether and how to use the 2005-2007 SMI measures.

## E.7 Variables Available on the Data File

All of the variables defined above for the K6, SPD, and WHODAS are included on the 2020 data file. For the K6 and SPD, this includes the distress scores (K6SCMON and K6SCYR), both versions of the worst month K6 total score (WSPDSC2 and K6SCMAX), and past month and past year SPD (SPDMON and SPDYR). For the worst month K6 total score, the original version (K6SCMAX) is used in the creation of the SPD variables, and the alternative version (WSPDSC2) is used in the creation of the mental illness variables for both the 2008 and 2012 prediction models.

From the WHODAS, both versions of the WHODAS total score (WHODASC2 and WHODASC3) are included on the 2020 data file. While the original WHODAS total score (WHODASC2) was not used in either the 2008 or 2012 prediction model for the final creation of the mental illness variables, it is included in the dataset.

None of the predictor variables used in the 2005-2007 alternative model are included on the data file. Though some are similar in topic, these predictor variables are defined differently than predictor variables used in the 2008 or 2012 models. The alternative model variables end with “\_A” to indicate these variables were generated using the 2005-2007 alternative model rather than the 2012 model. The variables SMIPP\_A and SMIYR\_A are considered comparable with the variables SMIPP\_U and SMIYR\_U, respectively, for 2008 and later<sup>18</sup> NSDUHs. However, users should consider the differences in methodology before making any decisions on whether and how to use the 2005-2007 SMI variables.

Measures of mental illness were renamed due to the use of the 2012 model to define SMI. Measures of mental illness based on the 2012 prediction model are included on the 2020 data file.<sup>19</sup> The variable names for these measures based on the 2012 model end with “\_U” to indicate these variables are not comparable with similarly named variables (based on the “2008 model”) in previous years. [Table E.5](#) displays a crosswalk between the 2008 model and revised 2012 model mental illness variable names.<sup>20</sup> In addition to measures of mental illness, [Table E.5](#) also displays mental illness combination variables with substance use disorder (SUD). Due to the questionnaire redesign for the 2015 NSDUH, SUD was no longer comparable. Starting with the 2015 NSDUH, the co-occurring mental illness and SUD variables were renamed to reflect the break in comparability and no longer end with “\_U.” Then in the 2020 NSDUH, additional versions of the SUD variables were added to the data file based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013). Therefore, the co-occurring mental illness and SUD variables were again renamed to reflect the

---

<sup>18</sup> See footnote 4.

<sup>19</sup> These variables are included on the 2012 data file, and data files from 2008 to 2011 were updated with the 2012 model-based mental illness variables.

<sup>20</sup> A variable defined as low or moderate mental illness (LMMIYRU) based on the 2012 model was added during the 2014 NSDUH. LMMI was not added to this table because there is not a 2008 model equivalent variable.

2020 break in comparability with previous years as signified by the “SUD5” naming convention. For more information on the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994), and DSM-5 SUD variables, see the 2020 Nicotine Dependence and Substance Use Disorder codebook appendix.

The mental illness variables based on the 2008 prediction model are no longer available on the data files for any of the survey years. While the specific mental illness measures based on the 2008 model are no longer available, the predicted probability of the SMI variable, SMIPP, remains available on the 2008-2011 files.<sup>21</sup> For more information on how to use SMIPP from the 2008 model to create the mental illness measures and additional information on how to use the 2008 model measures, see Appendix B, Section B.4.3, in the 2009 mental health findings report (CBHSQ, 2010b). However, mental illness variables based on the 2008 model are no longer recommended for use in analysis.

**Table E.5 Mental Illness Variable Names, 2008 Model and Revised 2012 Model**

Mental Illness Variable Name: 2008 Model	Mental Illness Variable Name: Revised 2012 Model	Variable Label
SMIYR	SMIYR_U	RC-SMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB
SMIPP	SMIPP_U	RC-PREDICTED SERIOUS MENTAL ILLNESS PROB REVISED
SMMIYR	SMMIYR_U	RC-SMMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB
AMIYR	AMIYR_U	RC-AMI IND (1/0) BASED ON REVISED PREDICTED SMI PROB
MMIYR	MMIYR_U	RC-MODERATE MI IND (1/0) BASED ON REVISED PRED SMI PROB
LMIYR	LMIYR_U	RC-MILD MI IND (1/0) BASED ON REVISED PREDICTED SMI PROB
MI_CAT	MI_CAT_U	RC-CATEGORICAL MI INDICATOR REVISED
AMIADPA2	AMISUDPY <sup>1</sup>	RC-AMI AND DRUG/ALCOHOL DEP OR ABUSE-PAST YEAR-DSM-IV
--	AMISUD5YR <sup>2</sup>	RC-AMI AND SUBSTANCE USE DISORDER-PAST YEAR-DSM-5
SMIADPA2	SMISUDPY <sup>1</sup>	RC-SMI AND DRUG/ALCOHOL DEP OR ABUSE-PAST YEAR-DSM-IV
--	SMISUD5YR <sup>2</sup>	RC-SMI AND SUBSTANCE USE DISORDER-PAST YEAR-DSM-5

NOTE: Mental illness aligns with criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994), and is defined as having a diagnosable mental, behavioral, or emotional disorder, other than a developmental or substance use disorder. Serious mental illness (SMI) is a subset of any mental illness (AMI) because SMI is limited to people with AMI that resulted in serious functional impairment. These mental illness variables are based on a predictive model and are not direct measures of diagnostic status.

NOTE: For 2020, the mental illness variable names based on DSM-IV have remained unchanged because comparability is unknown. Caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years. For information on comparability, see the Key Mental Health Variable codebook appendix.

<sup>1</sup> These variables were renamed starting with the 2015 NSDUH and are not comparable with prior year’s variables due to the questionnaire redesign. From 2009 to 2014, these variables were called AMIDA2\_U and SMIDA2\_U, respectively.

<sup>2</sup> Starting with the 2020 NSDUH, co-occurring mental illness variables and the substance use disorder (SUD) variables based on criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013), were created. The DSM-5 SUD variables are not comparable with similarly named DSM-IV substance dependence or abuse variables from previous survey years. For more information on the DSM-IV and DSM-5 SUD variables, see the 2020 Nicotine Dependence and Substance Use Disorder codebook appendix.

For all the mental illness measures defined below, youths aged 12 to 17 were classified as system missing (.) because the mental health section was not administered to youths. The predicted probability of SMI, SMIPP\_U, based on the 2012 prediction model is included on the 2008-2020 data files and ranges in value from 0.0025409721 to 0.9291205406. Cutoff points

---

<sup>21</sup> SMI variables for the 2005-2007 NSDUHs based on an alternative model are available and the variables end with an “\_A” to indicate the use of an alternative model. See the report describing the alternative model for more details (CBHSQ, 2017a).

along the range of SMIPP\_U were used to determine the levels of mental illness for each respondent:

#### 2008 Sample A (WHODAS) and 2009 to 2020

- SMI:<sup>22</sup> If SMIPP\_U is greater than or equal to 0.260573529, then the respondent is classified as having past year SMI (SMIYR\_U=1).
- SMMI: If SMIPP\_U is greater than or equal to 0.077686285365, then the respondent is classified as having past year SMMI (SMMIYR\_U=1).
- AMI: If SMIPP\_U is greater than or equal to 0.0192519810, then the respondent is classified as having past year AMI (AMIYR\_U=1).
- No Mental Illness: If SMIPP\_U is less than 0.0192519810, then the respondent is classified as not having past year mental illness (AMIYR\_U=0).

#### 2008 Sample B (SDS)

- SMI: If SMIPP\_U is greater than or equal to 0.236434, then the respondent is classified as having past year SMI (SMIYR\_U=1).
- SMMI: If SMIPP\_U is greater than or equal to 0.06616398, then the respondent is classified as having past year SMMI (SMMIYR\_U=1).
- AMI: If SMIPP\_U is greater than or equal to 0.019182625, then the respondent is classified as having past year AMI (AMIYR\_U=1).
- No Mental Illness: If SMIPP\_U is less than 0.019182625, then the respondent is classified as not having past year mental illness (AMIYR\_U=0).

The categories of MMI and LMI were created by subtraction using a combination of the three defined levels of mental illness shown above. Respondents were classified as having past year MMI (MMIYR\_U=1) if they were positive for SMMI (SMMIYR\_U=1) but negative for SMI (SMIYR\_U=0). Respondents were classified as having past year LMI (LMIYR\_U=1) if they were positive for AMI (AMIYR\_U=1) but negative for SMMI (SMMIYR\_U=0). MMI and LMI are no longer shown in the detailed tables starting with the 2016 NSDUH. During the 2014 NSDUH, a new level of mental illness was created called low or moderate mental illness (LMMI). Respondents were classified as having past year LMMI (LMMIYR\_U=1) if they were positive for LMI (LMIYR\_U=1) or MMI (MMIYR\_U=1). LMMI was first created for the 2014 NSDUH and is available for all years 2008 through 2020. LMMI was used in the 2020 detailed tables (CBHSQ, 2021a) showing estimates described as AMI excluding SMI. See the 2020 key substance use and mental health indicators in the United States report (SAMHSA, 2021).

The categories of SMI, LMI, and MMI were combined to create an overall mental illness indicator (MI\_CAT\_U), which is defined so that a respondent with LMI is coded 1, a respondent with MMI is coded 2, and a respondent with SMI is coded 3. Respondents with no past year mental illness are coded 0.

---

<sup>22</sup> SMI variables in 2008 and subsequent years are not comparable with similarly named SMI variables from 2002 to 2003.

See the Key Mental Health Variables codebook appendix for a table listing key 2002-2020 NSDUH mental health measures, variable names, and information concerning comparability across survey years.<sup>23</sup>

## E.8 Using Mental Illness Variables in Analysis

For the 2008 NSDUH, while SMI data for both half samples (SDS and WHODAS) could be analyzed together when using the 2008 model, the AMI, SMMI, LMI, and MMI data from the two half samples could not be combined for analysis. Under the 2012 model, both the 2008 half samples can be combined for the analysis of SMI as well as the other levels of mental illness because the 2012 models were generated such that the estimates would be comparable.

The predicted mental illness variables (e.g., SMIYR\_U, AMIYR\_U) that were derived from the 2012 model were examined to determine how they were associated with the mental health predictor variables in the 2012 model. It was found that the 2012 model significantly overestimated the proportion of adults aged 18 or older with SMI (and those with AMI) who had suicidal thoughts in the past year and also the proportion of adults who had MDE in the past year. Therefore, it is recommended that the mental illness variables derived from the 2012 model should not be used when analyzing past year suicidal thoughts, past year MDE, or other associated variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, or lifetime MDE). Similarly, it is recommended that model-based mental illness variables should not be used in conjunction with the K6 variables (including SPD) or WHODAS variables in any analyses. This recommendation also applies to the 2005-2007 model-based measures. See the 2012 MHSS design and estimation report for more details (CBHSQ, 2014a).

## E.9 Standard Errors for Mental Illness Measures

Standard errors for SMI estimates (and, likewise, estimates for AMI, SMMI, MMI, LMI, and LMMI) were computed using the NSDUH predicted values as if they were actual values. This ignores the added error resulting from fitting the 2012 SMI model, which can be very large (CBHSQ, 2014a). These standard errors, however, are more reasonable to use when making comparisons across years and across subpopulations within years because the errors due to model fitting are roughly the same across the estimates being compared. However, caution is advised when these mental illness measures are used as explanatory variables within a regression analysis because the resulting estimated regression coefficients often will be biased toward zero (Carroll et al., 2006). Stated another way, values of the regression coefficients for these mental illness variables are likely to be attenuated. Consequently, situations in which AMI or specific levels of mental illness (e.g., SMI) are true predictors of a dependent variable of interest in the population may not be significant predictors in regression models that use these variables. If a statistically significant association is identified between these mental illness variables and the dependent variable, however, one can be more confident that this truly is a significant association.

---

<sup>23</sup> Cautioning against comparisons with the 2020 data does not *necessarily* mean the data are not comparable. For most estimates, comparability is unknown. More information on comparability may be available in the future.

## **E.10 Analysis Weight and Variance Estimation Variables for the Mental Illness, K6, and SPD Measures**

Information on how to weight the mental illness measures for adults across survey years using the file, including 2020, is provided below to explain how the estimates were created as seen in the multiyear trend analyses published in the 2020 detailed tables (CBHSQ, 2021a). As previously described, the 2020 NSDUH underwent methodological changes because of COVID-19. Given the differences in data collection periods and other methodological changes to procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from applicable prior years in the 2020 detailed tables. Comparisons of 2020 data with prior years of NSDUH data should be done taking these changes into consideration.

Because variables for past year mental illness measures among adults in 2020 were not imputed, the break-off analysis weight, described in the Analysis Weight and Variance Estimation Variables for Suicidal Thoughts and Behavior Measures section, was used to produce the 2020 estimates in the detailed tables. As noted above, the break-off analysis weight is excluded from the file for potential disclosure risk. Caution should be used for analyzing the outcomes in the mental health and subsequent sections of the codebook and for drawing conclusions using the main PUF analysis weights (ANALWTQ1Q4\_C).

If combining 2020 with prior years of NSDUH data, the 2020 person-level analysis weight variable names and variance estimation variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. See the Use of Special Types of Analyses section of the codebook introduction for more details.

### **E.10.1 Mental Illness Measures**

Mental illness measures (i.e., SMI, AMI, SMMI, MMI, LMI, and LMMI) that are defined based on the 2012 model should be analyzed using the standard analysis weight (ANALWT\_C) for all survey years 2008 through 2019 and the standard analysis weight (ANALWTQ1Q4\_C) for 2020. With the revised 2012 model, both the WHODAS and SDS 2008 half samples can be combined to form single estimates by creating a new weight variable that takes on the value of ANALWT\_C for 2008 to 2019 and the value of ANALWTQ1Q4\_C for 2020.

This differs from the initial recommendation for analyzing other measures of mental illness besides SMI based on the 2008 model. Due to the 2008 split sample, an adjusted mental health sample weight, MHSAWT\_C, was created so that the WHODAS and SDS half samples were separately representative of the civilian, noninstitutionalized population aged 18 or older. However, this weight should not be used to analyze 2008 mental illness data based on the 2012 model.

Analyses using SMI across all years 2005 and later would also be analyzed using the standard analysis weight (ANALWT\_C) for 2005 to 2019 and the standard analysis weight (ANALWTQ1Q4\_C) for 2020. Users should consider the differences in methodology prior to making any decisions on whether or how to use this data across all years.

## **E.10.2 2005-2020: K6 and SPD Measures**

Analyses of past year K6 and SPD can be measured with the adjusted past year K6 and SPD variables from 2005 through 2007 and the past year SPD variables from 2008 through 2020. Users should create a new weight variable that takes on the value of ANALWT\_C for 2005 to 2019 and the value of ANALWTQ1Q4\_C for 2020.

## **E.10.3 Variance Estimation**

For analyses of mental illness, K6, and SPD measures, users should create a new variance estimation stratum variable that takes on the value of VESTR for 2002-2019 respondents and the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2002 to 2020.

## **Appendix F**

### **Recoded Depression Variable Documentation**

## F.1 Introduction

The 2020 National Survey on Drug Use and Health (NSDUH) computer-assisted interviewing (CAI) instrumentation included two modules, the adult depression module and the youth depression module, which were designed to measure whether or not respondents had experienced a major depressive episode (MDE) in their lifetime and past year. Additional questions to assess impairment levels caused by MDE and treatment received for depression were included at the end of each MDE module.

This appendix provides details about the questions designed to assess MDE, comparability issues across survey years, development of adjusted lifetime and past year MDE variables, variable naming conventions, and analysis and weighting information. Variable specifications for lifetime and past year MDE as well as MDE with severe impairment are also provided. A flowchart (see [Figure F.1](#)) is included to provide details regarding the routing logic leading up to the MDE questions specifying which respondents were asked the MDE questions and were classified as having MDE. The Key Mental Health Variables codebook appendix provides a table with the variable names for the most commonly used NSDUH mental health measures (including MDE) as well as information regarding comparability across survey years 2002 through 2020.

The NSDUH CAI questions designed to assess MDE symptoms were based on the criteria in the *Diagnostic and Statistical Manual of Mental Disorders (DSM-5)*, 5<sup>th</sup> edition (American Psychiatric Association, 2013). More specifically, MDE questions for adults were adapted from the depression section of the National Comorbidity Survey-Replication (NCS-R; Harvard School of Medicine, 2005), and those for youths were adapted from the depression section of the National Comorbidity Survey-Adolescent (NCS-A; Harvard School of Medicine, 2005). To make the modules developmentally appropriate for youths, there are minor wording differences in a few questions between the adult and youth modules. People were classified as having had a lifetime MDE if they had five or more of nine symptoms for MDE in the same 2-week period in their lifetime, in which at least one of the symptoms was a depressed mood or loss of interest or pleasure in daily activities. People were classified as having MDE in the past year if they had a lifetime MDE and a period of time in the past 12 months when they felt depressed or lost interest or pleasure in daily activities for 2 weeks or longer, while also having some of the other symptoms for lifetime MDE.

The coronavirus disease 2019 (COVID-19) pandemic made 2020 a unique year within the history of NSDUH. Estimates for adult and youth depression in the 2020 detailed tables (Center for Behavioral Health Statistics and Quality [CBHSQ], 2021b) have been calculated using data from combined Quarters 1 and 4 of 2020. Quarter 1 (January to March 2020) was completed using standard NSDUH protocols with in-person data collection. However, Quarter 1 data collection ended 15 days early when work was suspended on March 16, 2020. Except for a very brief data collection effort that tested increased safety measures in July, no data were collected in Quarters 2 and 3 (i.e., April to September). For weighting, imputation, and estimation, the small number of Quarter 3 (i.e., July data) interviews were grouped with the Quarter 4 data. Data collection resumed in Quarter 4 but used in-person and web-based procedures. For simplicity, references of Quarter 4 in the 2020 detailed tables refer to the combined Quarters 3 and 4 data. The Substance Abuse and Mental Health Services

Administration (SAMHSA) decided to produce estimates for 2020 using the combined data to increase the sample sizes and resulting precision of the estimates. The content of the adult depression and youth depression questions did not change between Quarters 1 and 4.<sup>1</sup> Thus, no changes were needed for the depression variable specifications because the questions in 2020 were equivalent to those in 2019. To protect respondents' confidentiality, the variable QUARTER was removed from the file so that no quarterly analyses can be generated. Given the differences in data collection periods and other methodological procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from prior years in the 2020 detailed tables and first findings report (SAMHSA, 2021). Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years. Caution should also be used when attempting to distinguish the effects on estimates due to true changes in the population<sup>2</sup> (e.g., COVID-19, other events) from the effects due to methodological changes. Regardless, general information on how to compare, combine, and weight the adult and youth depression data across survey years, including 2020, is provided in this appendix. Caveats regarding the 2020 data are also provided where applicable. See Chapters 2, 3, and 6 of the 2020 methodological summary and definitions for details (CBHSQ, 2021a).

When the depression modules were first introduced in 2004, all youth respondents, but only half of adult respondents, received the questions because of a split-sample design. Further details on the 2004 split sample are provided in Appendix A of the 2004 national findings report (Office of Applied Studies [OAS], 2005b). Starting with the 2005 NSDUH, all youth and adult respondents received the questions in their respective depression modules. In the 2008 NSDUH, the adult mental health module was updated. This module precedes the adult depression module in the questionnaire which remained unchanged. In this revised 2008 mental health module, the K6 questions on nonspecific psychological distress were asked about two reference periods, the past 30 days and the month in the past 12 months when the distress was the worst. In addition, adult respondents were administered the mental health module through a split-sample design consisting of one of two impairment scales, an abbreviated World Health Organization Disability Assessment Schedule (WHODAS) or the Sheehan Disability Scale (SDS), to measure impairment due to emotions, nerves, or mental health. See the 2008 Recoded Mental Health codebook appendix for further details. Starting in 2009, the split sample was removed, and the CAI instrument included only the WHODAS questions.

These changes and the fact that this revised mental health module precedes the adult depression module within the questionnaire could have influenced the adult respondent's answers to subsequent depression-related items. This type of influence is referred to as a context effect. A detailed analysis was conducted to examine potential context effects on MDE variables based on the changes in the mental health module. It was determined that MDE estimates for adults aged 18 or older from 2008 could not be compared with the 2007 and prior year estimates. Two subsamples (i.e., WHODAS and SDS) also were examined to determine whether the MDE

---

<sup>1</sup> Interviewer-administered questions from in-person data collection needed to be modified for web-based data collection, but the basic content of the questions did not change. See Section 2.2.2.4 of the *2020 National Survey on Drug Use and Health (NSDUH): Methodological Summary and Definitions* (Center for Behavioral Health Statistics and Quality [CBHSQ], 2021a).

<sup>2</sup> A true change in a population survey estimate across years is a change that is not plausibly explained by changes in survey data collection methods between those years.

data from the two 2008 subsamples were comparable. Because of differences in MDE estimates between the two samples, combining the SDS and WHODAS half-samples to produce an overall 2008 adult MDE estimate is not recommended. This applies to all adult MDE-related estimates (treatment/counseling for MDE, MDE-related impairment, etc.). Therefore, given the potential for comparability issues and to facilitate future trend analysis, only the WHODAS half-sample (MHSAMP08=1) is used for 2008 adult MDE estimation in the 2008 detailed tables (OAS, 2009a). See Appendix B, Section B.4.7, in the 2008 national findings report (OAS, 2009b) for further details on the decisions on the 2008 analyses.

Starting with the 2009 NSDUH, the mental health module included only the WHODAS questions; therefore, the estimates for adult MDE from 2009 onward<sup>3</sup> can be compared with the WHODAS half-sample from 2008. See Appendix B, Section B.4.2, in the 2009 mental health findings report (CBHSQ, 2010b) for details on the 2009 analyses.

In order to be able to use the full sample of 2008 data and also to make adult MDE comparisons across survey years starting with 2005 and continuing through 2008 and later years,<sup>4</sup> adjusted versions of only adult past year MDE (AJAMDEYR) and adult lifetime MDE (AJAMDELT) variables were created retroactively for the years 2005 through 2008. These variables were adjusted to make MDE estimates from the SDS half-sample in 2008 and all adult respondents for 2005 through 2007 comparable with the MDE estimates based on the WHODAS half-sample in 2008 and all adult respondents in later years.<sup>5</sup> More information about how the statistically adjusted adult MDE analysis variables were created can be found in the 2005-2008 codebooks and in the report describing these adjustments (Aldworth et al., 2012).

In 2009, changes were made to the youth mental health service utilization questions that preceded the questions about youth depression. These changes included the replacement of five questions that asked about receipt of special education services and school counseling and time spent in jail or foster care with questions that asked about receipt of mental health services in the education and justice system sectors. The presence of new items could have influenced how youths responded to the youth depression questions and therefore the estimates of youth MDE. An analysis was performed that showed these questionnaire changes in 2009 did not appear to affect the estimates of youth MDE. Therefore, it is possible to assess trends for past year MDE from 2004 and later years<sup>6</sup> for youths aged 12 to 17 without the need for adjusted variables. For more information on the 2009 youth analyses results, see Appendix B, Section B.4.2, in the 2009 mental health findings report (CBHSQ, 2010b).

## F.2 Naming Conventions

In the 2004-2007 NSDUHs, MDE data from both the adult and youth modules were used to create single, combined recoded lifetime (MDELT) and past year MDE (MDEYR) variables, even though adult and youth data were not comparable because of wording differences between the modules. In the 2004-2007 detailed tables, analyses using combined variables were subset to

---

<sup>3</sup> Caution is advised when comparing 2020 to prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details.

<sup>4</sup> See footnote 2.

<sup>5</sup> See footnote 2.

<sup>6</sup> See footnote 2.

the age group of interest to present estimates separately for adults and youths (OAS, 2005a; 2006; 2007; 2008). Note that in the 2004 detailed tables only, estimates were also presented for adults and youths combined, but producing combined estimates is no longer recommended.

Starting with the 2008 NSDUH, the MDE variables were renamed, and a separate set of variables was created each for adults and for youths. The new variable names have continued to be used in the 2020 NSDUH. Under the new naming convention, adult MDE variables begin with “A” and youth MDE variables begin with “Y” (e.g., AMDEYR, YMDEYR). The youth MDE with impairment variable (MDEIMPY) does not follow this naming convention. Variables where youth and adult data were not combined into a single variable prior to 2008 were not renamed for youths (i.e., YSDSHOME, YSDSWRK, YSDSREL, YSDSSOC, YSDSOVRL, and MDEIMPY), since there was no change in variable construction or comparability. In addition, prior to 2008, the combined set of MDE variables was located in the Recoded Adult and Adolescent Depression section of the codebook. Currently, all adult and youth MDE variables are now located in either the Recoded Adult Depression or Recoded Adolescent Depression sections, respectively.

For adults, the new variable names denoted a break in the trend for the estimates due to the context effects noted earlier. To address the break in the trend, an adjustment was applied to the 2005-2008 adult MDE data, and the resulting new variables were retroactively added to the respective data files. These adjusted adult MDE variables begin with the abbreviation “AJ” for “adjusted” (i.e., AJAMDEYR, AJAMDELT). With the addition of the adjusted adult MDE variables, the documentation for the existing adult MDE variables was retroactively revised to refer to the existing variables as unadjusted adult MDE variables. In summary, for adults, the new variable names indicated that the MDE data from 2008 or later should not be compared or combined with unadjusted variables from 2004 to 2007. However, adjusted variables were later added for 2005 through 2008 to allow comparisons across years from 2005 onward.<sup>7</sup> Adjusted adult MDE variables are not available for 2004. The adjusted variables for 2005 through 2008 can be renamed to match the adult past year MDE (AMDEYR) and adult lifetime MDE (AMDELT) variables for 2009 and subsequent years to produce comparable estimates across years,<sup>8</sup> as seen in the 2020 detailed tables (CBHSQ, 2021b).<sup>9</sup>

### F.3 Comparability between Years

New variable names typically indicate changes that may or may not impact comparability with prior years.<sup>10</sup> As described above, the 2008 adult MDE estimates are not considered comparable with 2007 and prior years. For youths, despite the new variable names, the MDE data from 2008 or later<sup>11</sup> can be compared or combined with MDE data from 2004 to 2007 since there was no change to the youth modules. But in order to do so, either the original or new set of youth MDE variables should be renamed to match the other so that the data can be combined.

---

<sup>7</sup> See footnote 2.

<sup>8</sup> See footnote 2.

<sup>9</sup> Statistical testing was not conducted for the 2020 detailed tables due to methodological changes.

<sup>10</sup> For 2020, the variable names are the same, but caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years due to comparability of the data being unknown.

<sup>11</sup> See footnote 2.

See the 2008 Recoded Depression Variable Documentation codebook appendix for sample code on how to rename the 2008 or later survey year variables back to prior year names.

Due to differences in the data collection periods and other methodological procedures between 2020 and prior NSDUH years, the effects of methodological changes versus real behavioral changes in the population cannot fully be separated. Cautioning against comparisons does not *necessarily* mean the data are not comparable. For most estimates, comparability is unknown. More information on comparability may be available in the future. In the meantime, because the adult and depression questions as well as the coding specifications remained unchanged from 2019, the 2020 variables names were also unchanged.

A summary of variable names and comparability across years is presented in [Table F.1](#) for both adult and youth lifetime and past year MDE. For 2004 through 2019, all variables in a column are comparable for the survey years specified despite nonidentical variable names. For 2020, the variable names were unchanged. However, the 2020 variable names are italicized to indicate that comparability is unknown and caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years. Italics are similarly used for the 2020 estimates when they are presented beside estimates from prior survey years in the 2020 detailed tables (CBHSQ, 2021b) and first findings report (SAMHSA, 2021).

**Table F.1 Lifetime and Past Year Major Depressive Episode (MDE) Variable Comparability: 2004 NSDUH and Later Survey Years**

NSDUH Survey Year	Adult MDE			Youth MDE
	Comparable Variables 2004-2007	Comparable Variables 2008 and Later Years <sup>1</sup> Unadjusted Data	Comparable Variables 2005 and Later Years <sup>1</sup> Adjusted Data	Comparable Variables 2004 and Later Years <sup>1</sup>
2004	MDELT, MDEYR <sup>2</sup>			MDELT, MDEYR <sup>2</sup>
2005-2007	MDELT, MDEYR <sup>2</sup>		AJAMDELT, AJAMDEYR	MDELT, MDEYR <sup>2</sup>
2008		AMDELT, AMDEYR <sup>3</sup>	AJAMDELT, AJAMDEYR	YMDELT, YMDEYR
2009-2019		AMDELT, AMDEYR	AMDELT, AMDEYR	YMDELT, YMDEYR
2020 <sup>1</sup>		<i>AMDELT,</i> <i>AMDEYR</i>	<i>AMDELT,</i> <i>AMDEYR</i>	<i>YMDELT,</i> <i>YMDEYR</i>

NOTE: For 2004 through 2019, all the variables within the same column are comparable across years once the variables have been renamed to match. For 2020, the variable names are the same, but caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years due to comparability of the data being unknown.

<sup>1</sup> Estimates in the 2020 row are italicized to indicate caution should be used when comparing 2020 to prior years due to methodological changes for 2020. See Chapter 6 of the 2020 *National Survey on Drug Use and Health (NSDUH): Methodological Summary and Definitions* for details.

<sup>2</sup> To use these lifetime and past year MDE variables in comparisons, the data must be subset to adults or youths depending on the analysis of interest. Presenting estimates using combined adult and youth data is not recommended due to wording differences between the adult and youth modules.

<sup>3</sup> To use these lifetime and past year MDE variables in comparisons, the data must be subset to the WHODAS subsample (MHSAMP08=1).

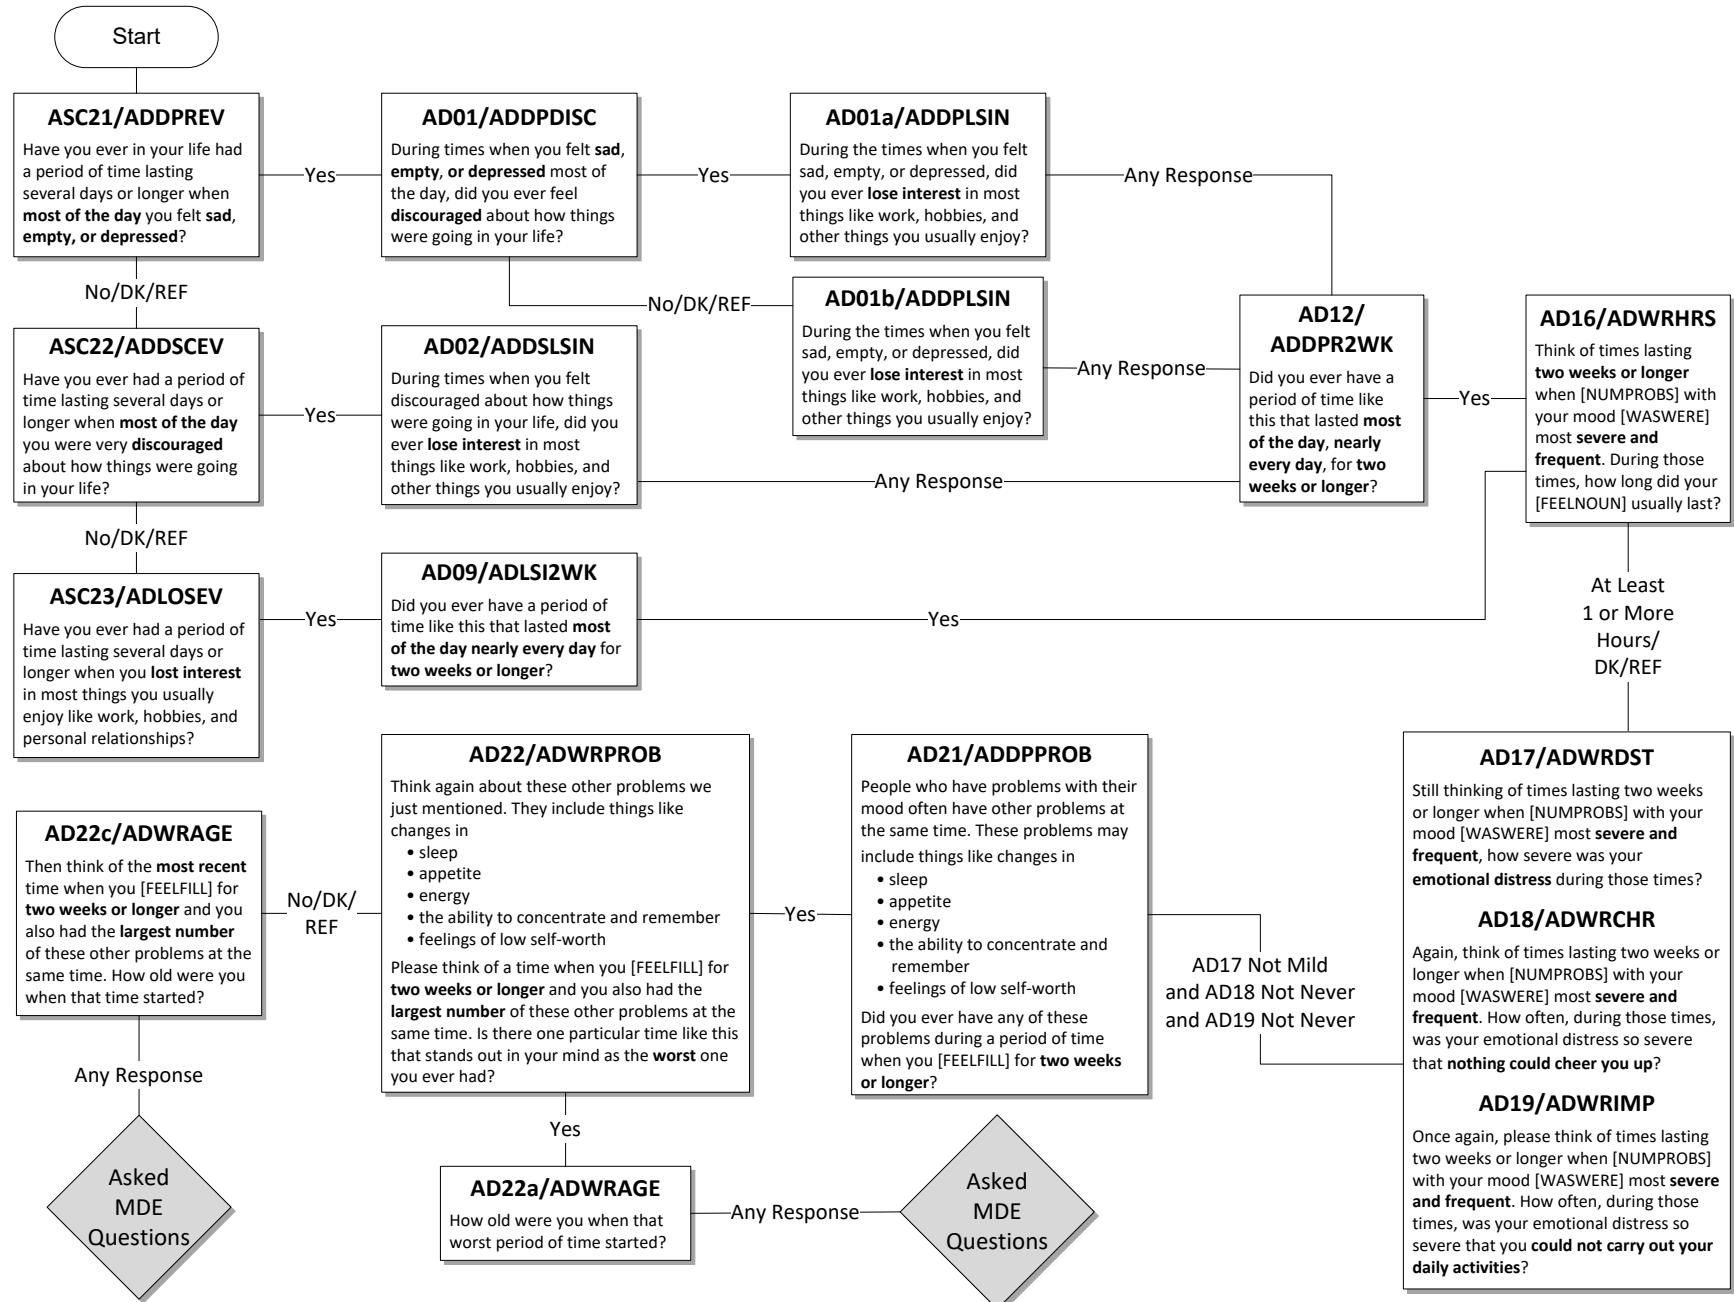

Source: SAMHSA, Center for Behavioral Health Statistics and Quality (formerly Office of Applied Studies), National Survey on Drug Use and Health, 2004 and later years.

## **F.4 MDE Variable Specifications**

In the adult and youth depression modules of the NSDUH, respondents were asked a series of introductory questions to determine whether they had a worst period of time where they experienced feeling sad, empty, depressed, discouraged, or a loss of interest. If a respondent fit certain criteria based on the routing logic found in these introductory questions, then they were asked the questions related to the nine attributes (symptoms) of MDE. To demonstrate which respondents were actually asked the MDE attributes questions based on these introductory questions, a flowchart using the adult questions is included as [Figure F.1](#). These introductory questions in addition to the questions related to the nine attributes associated with MDE (see below) were used to score MDE.

This appendix includes information used for adults to classify the lifetime adult MDE variable (AMDELT), the adult past year MDE variable (AMDEYR), and the adult impairment recodes, all of which are found in the Recoded Adult Depression section of the codebook. Similar questions were asked of youth respondents and used to define similar youth MDE variables found in the Recoded Adolescent Depression section but are not specifically defined in this appendix. The questions shown in the flowchart and the documentation below refer to the adult depression-associated question indicator from the CAI instrument specifications followed by the corresponding edited variable name to assist users in mapping the information back to the CAI.

**Figure F.1 Routing Logic Prior to Adult Major Depressive Episode (MDE) Attribute Questions**

The questions below showing the nine attributes of MDE refer to the worst period of time the respondent has had that stood out in the respondent's mind; or, if the respondent did not recall a worst period of time, the questions refer to the most recent period of time when the respondent experienced any or all of the following: sadness, discouragement, or lack of interest in most things. These questions were asked once an adult respondent was routed through the CAI as indicated in the flowchart above. **It should be noted that no exclusions were made for MDE caused by medical illness, bereavement, or substance use disorders.**

During that [worst/most recent] period of time...

### **1. Depressed mood most of the day**

- a. ... did you feel sad, empty, or depressed **most of the day nearly every day?** (AD24A/ADWRDEPR)
- b. ... did you feel discouraged about how things were going in your life **most of the day nearly every day?** (AD24C/ADWRDISC)

Respondents were assigned a positive response to this symptom (D\_MDEA1/AD\_MDEA1=1) if they answered yes to either of the above questions.

### **2. Markedly diminished interest or pleasure in all or almost all activities most of the day**

- a. ... did you lose interest in almost all things like work and hobbies and things you like to do for fun? (AD24E/ADWRLSIN)
- b. ... did you lose the ability to take pleasure in having good things happen to you, like winning something or being praised or complimented? (AD24F/ADWRPLSR)

Respondents were assigned a positive response to this symptom (D\_MDEA2/AD\_MDEA2=1) if they answered yes to either of the above questions.

### **3. Weight**

- a. Did you have a much smaller appetite than usual nearly every day during that time? (AD26A/ADWRELES)
- b. Did you have a much **larger** appetite than usual nearly every day? (AD26B/ADWREMOR)
- c. Did you gain weight without trying to during that [worst/most recent] period of time? (AD26C/ADWRGAIN)
  - i. ... because you were growing? (AD26C1/ADWRGROW)
  - ii. ... because you were pregnant? (AD26C2/ADWRPREG)
- d. How many pounds did you gain? (AD26D/ADWRGNL2)
- e. Did you **lose** weight without trying to? (AD26E/ADWRLOSE)
  - i. ... because you were sick or on a diet? (AD26E1/ADWRDIET)
- f. How many pounds did you lose? (AD26F/ADWRLSL2)

Respondents were assigned a positive response to this symptom (D\_MDEA3/AD\_MDEA3=1) if they answered yes to questions 'a' or 'b' above, or the

answer to either question ‘d’ or ‘f’ was greater than or equal to 10. (Note that ‘d’ was only asked if ‘ $c_i$ ’ and ‘ $c_{ii}$ ’ were not ‘yes,’ and ‘f’ was only asked if ‘ $e_i$ ’ was not ‘yes.’)

#### **4. Insomnia or hypersomnia**

- a. Did you have a lot more trouble than usual falling asleep, staying asleep, or waking too early nearly every night during that [worst/most recent] period of time?  
(AD26G/ADWRSLEP)
- b. During that [worst/most recent] period of time, did you sleep a lot more than usual nearly every night? (AD26H/ADWRSMOR)

Respondents were assigned a positive response to this symptom  
(D\_MDEA4/AD\_MDEA4=1) if they answered yes to either of the above questions.

#### **5. Psychomotor agitation or retardation**

- a. Did you talk or move more slowly than is normal for you nearly every day?  
(AD26L/ADWRSLOW)
  - i. (if AD26L=1) Did anyone else notice that you were talking or moving slowly?  
(AD26M/ADWRSLNO)
- b. Were you so restless or jittery nearly every day that you paced up and down or couldn’t sit still? (AD26N/ADWRJITT)
  - i. (if AD26N=1) Did anyone else notice that you were restless?  
(AD26O/ADWRJINO)

Respondents were assigned a positive response to this symptom  
(D\_MDEA5/AD\_MDEA5=1) if they answered yes to either of the above ‘ $a_i$ ’ or ‘ $b_i$ ’ questions. (Note that ‘ $a_i$ ’ was only asked if ‘a’ was ‘yes’ and ‘ $b_i$ ’ was only asked if ‘b’ was ‘yes.’)

#### **6. Fatigue or loss of energy**

- a. During that [worst/most recent] period of time, did you feel tired or low in energy nearly every day, even when you had not been working very hard? (AD26J/ADWRENRG)

Respondents were assigned a positive response to this symptom  
(D\_MDEA6/AD\_MDEA6=1) if they answered yes to the above question.

#### **7. Feelings of worthlessness**

- a. Did you feel that you were not as good as other people nearly every day?  
(AD26U/ADWRNOGD)
  - i. (if AD26U=1) Did you feel totally worthless nearly every day?  
(AD26V/ADWRWRTH)

Respondents were assigned a positive response to this symptom  
(D\_MDEA7/AD\_MDEA7=1) if they answered yes to question ‘ $a_i$ .’ (Note that ‘ $a_i$ ’ was only asked if ‘a’ was ‘yes.’)

## **8. Diminished ability to think or concentrate or indecisiveness**

- a. During that [worst/most recent] period of time, did your thoughts come much more slowly than usual or seem confused nearly every day? (AD26P/ADWRTHOT)
- b. Did you have a lot more trouble concentrating than usual nearly every day? (AD26R/ADWRCONC)
- c. Were you unable to make decisions about things you ordinarily have no trouble deciding about? (AD26S/ADWRDCSN)

Respondents were assigned a positive response to this symptom (D\_MDEA8/AD\_MDEA8=1) if they answered yes to any of the above questions.

## **9. Recurrent thoughts of death or recurrent suicide ideation**

- a. Did you often think about death, either your own, someone else's, or death in general? (AD26AA/ADWRDLOT)
- b. During that period, did you ever think it would be better if you were dead? (AD26BB/ADWRDBTR)
- c. Did you think about committing suicide? (AD26CC/ADWRSTHK)
  - i. (if AD26CC=1) Did you make a suicide plan? (AD26DD/ADWRSPN)
  - ii. (if AD16CC=1) Did you make a suicide attempt? (AD26EE/ADWRSATP)

Respondents were assigned a positive response to this symptom (D\_MDEA9/AD\_MDEA9=1) if they answered yes to any of the above questions.

Respondents were classified with lifetime MDE (AMDELT=1 for adults) if they had at least five of the nine above attributes (DSMMDEA2/ADSMMDEA=1 for adults). Respondents were classified with not having lifetime MDE (AMDELT=2 for adults) if they met either of these conditions:

1. Reported experiencing fewer than five out of the nine criteria used to classify an adult as having had MDE in their lifetime (DSMMDEA2/ADSMMDEA=2).
2. If the number of criteria is unknown (DSMMDEA2/ADSMMDEA=98) and the respondent reported at least one of the following:
  - I. Never having had a period of time lasting several days or longer when felt sad, empty, or depressed (ASC21/ADDPREV=2), discouraged about how things were going in life (ASC22/ADDSCFV=2), and lost interest in most things usually enjoyable (ASC23/ADLOSEV=2).
  - II. Experienced the feelings in (I), but they did not last most of the day, nearly every day for two weeks or longer (AD09/ADLSI2WK=2) or (AD12/ADDPR2WK=2).
  - III. Experienced the feelings in (I) most of the day, nearly every day for two weeks or longer, but the feelings lasted less than an hour when mood was most severe and frequent (AD16/ADWRHRS=1).
  - IV. Experienced the feelings in (I) most of the day, nearly every day for two weeks or longer for at least an hour during those times when mood was most severe and frequent, but emotional distress was mild (AD17/ADWRDST=1),

there was never a time when emotional distress was so severe that you could not be cheered up (AD18/ADWRCHR=4), and there was never a time when your emotional distress was so severe that you could not carry out your daily activities (AD19/ADWRIMP=4).

- V. Experienced the feelings in (I) most of the day, nearly every day for two weeks or longer for at least an hour and the severe distress were more than mild or at some point could not be cheered up or could not carry out daily activities, but never had any other problems during those weeks, such as changes in sleep, appetite, energy, the ability to concentrate and remember, or feelings of low self-worth (AD21/ADDPPROB=2).

Respondents who were classified with lifetime MDE (AMDELT=1 for adults and YMDELT=1 for youths) and who reported that during the past 12 months they had a period of depression lasting 2 weeks or longer, while also having some of the other symptoms mentioned (ADPB2WK=1 for adults and YOPB2WK=1 for youths), were classified as having past year depression (AMDEYR=1 for adults and YMDEYR=1 for youths). Respondents with no lifetime MDE (AMDELT=2 for adults or YMDELT=1 for youths) or respondents with lifetime MDE (AMDELT=1 for adults and YMDELT=1 for youths) but no period of depression lasting 2 weeks or longer while having other symptoms (ADPB2WK=2 for adults or YOPB2WK=2 for youths) were classified as not having past year MDE (AMDEYR=2 for adults or YMDEYR=2 for youths).

Otherwise, respondents were classified as system missing for lifetime or past year MDE if they had unknown depression information and/or they were aged 12 to 17 (for adults) or aged 18 or older (for youth).

Respondents with lifetime MDE and respondents with recurrent thoughts of death or recurrent suicide ideation (D\_MDEA9/AD\_MDEA9=1 for adults and D\_MDEA9Y/YO\_MDEA9=1 for youths), regardless of MDE classification, were guided through the remainder of the depression module. Note that because of this second criterion, variables for treatment of depression may have values for respondents who were not classified as having lifetime MDE. If the subpopulation of interest is respondents with lifetime MDE or past year MDE, these restrictions should be implemented in the analysis using the appropriate variables. Users who are interested in the suicide ideation data<sup>12</sup> from the depression modules should also be aware of the routing logic shown in [Figure F.1](#) because only a subset of respondents are asked the suicide-related questions.

## F.5 MDE with Severe Impairment Variable Specifications

Respondents classified as having had MDE in the past year were then asked questions from the SDS to measure the level of functional impairment in major life activities reported to be caused by the MDE in the past 12 months (Leon et al., 1997).

The questions pertaining to the four domains are shown below with their associated question indicator from the CAI specifications as well as the edited variable name in parentheses

---

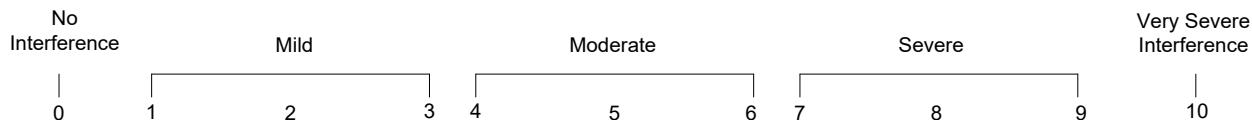

<sup>12</sup> The adult suicide estimates presented in the 2020 detailed tables (CBHSQ, 2021b) are from the mental health module data, not the depression suicide module data.

for both adults and youths. The SDS measures mental health-related impairment in four major life activities or role domains. These four domains are defined separately for adults aged 18 or older and youths aged 12 to 17 to reflect the different roles associated with the two age groups. Each module consists of four questions that are assessed on a 0 to 10 visual analog scale with categories of “no interference” (0), “mild” (1-3), “moderate” (4-6), “severe” (7-9), and “very severe” (10).

#### **F.5.1 Adult Depression Module: Functional Impairment**

- AD66a** Think about the time in the past 12 months when these problems with your mood were **most severe**.

Using the 0 to 10 scale shown below, where 0 means **no** interference and 10 means very **severe** interference, select the number that describes how much these problems interfered with your **ability to do** each of the following activities during that period. You can use any number between 0 and 10 to answer.

How much did your [depression symptoms] interfere with your **ability to do home management tasks**, like cleaning, shopping, and working around the house, apartment, or yard? (ADPSHMGMT)

- AD66b** During the time in the past 12 months when your [depression symptoms] were most severe, how much did this interfere with your **ability to work?** (ADPSWORK)

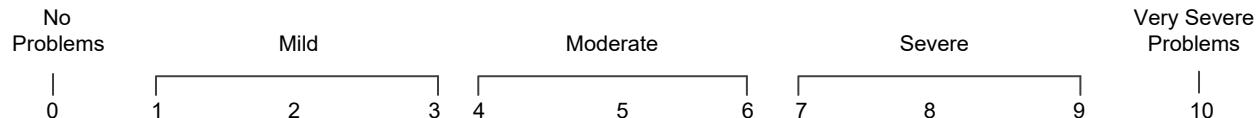

**AD66c** How much did your [depression symptoms] interfere with your **ability to form and maintain close relationships** with other people during that period of time? (ADPSRELS)

**AD66d** How much did [depression symptoms] interfere with your **ability to have a social life** during that period of time? (ADPSSOC)

### **F.5.2 Adolescent Depression Module: Functional Impairment**

- YD66a** Think about the time in the past 12 months when these problems with your mood were the **worst**.

Using the 0 to 10 scale shown below, where 0 means **no** problems and 10 means very **severe** problems, select the number that describes how much your [depression symptoms] caused problems with your **ability to do** each of the following activities during that time. You can use any number between 0 and 10 to answer.

How much did your [depression symptoms] cause problems with your chores at home? (YOPSHMGT)

- YD66b** During the time in the past 12 months when your [depression symptoms] were worst, how much did this cause problems with your **ability to do well at school or work?** (YOPSWORK)
- YD66c** How much did your [depression symptoms] cause problems with your **ability to get along with your family** during that time? (YOPSRELS)
- YD66d** How much did your [depression symptoms] cause problems with your **ability to have a social life** during that time? (YOPSSOC)

The four SDS role domain variables were recoded so that no interference=1, mild=2, moderate=3, severe=4, and very severe=5. A maximum impairment score (ASDSOVL2 for adults and YSDSOVRL for youths) was then defined as the single highest severity level of role impairment across all four SDS role domains. Ratings greater than or equal to 7 on the original SDS scale (ASDSOVL2 or YSDSOVRL=4, 5) were considered severe impairment. Respondents were classified as system missing if they had unknown impairment information for all four SDS domain variables, were not asked the question due to routing logic, and/or they were aged 12 to 17 (for adults) or aged 18 or older (for youths).

Estimates for past year MDE with severe impairment (AMDEIMP=1 for adults and MDEIMPY=1 for youths) are presented for 2009 to 2020 for adults and for 2006 to 2020 for youths in the 2020 detailed tables (CBHSQ, 2021b). The adult MDE with severe impairment variable is not comparable with NSDUH data prior to 2008 for the reasons discussed previously. Although the 2020 MDE with severe impairment estimates are presented beside estimates from prior survey years, comparability is unknown, and no significance testing was performed between 2020 and prior survey years. As noted earlier, the 2020 MDE with severe impairment estimates are italicized in the 2020 detailed tables to indicate a potential break in comparability.

## F.6 Analysis Weights and Variance Estimation Variables

For the 2020 NSDUH, the weighting process was modified to account for the disruption in data collection due to COVID-19 and the subsequent introduction of multimode data collection (in person and web) for NSDUH in Quarter 4. See Section 2.3.4.2 of the 2020 methodological summary and definitions for details on the modifications. One of the modifications had to do with the number of adult web respondents in Quarter 4 who provided usable information on their substance use—but did not complete the mental health or later sections (i.e., “break-offs”), which raised concerns about the 2020 mental health estimates for adults and

potential bias.<sup>13</sup> To overcome the bias issue, additional analysis weights (“break-off adjusted analysis weights”) were created to analyze unimputed outcome variables beginning with the mental health section of the questionnaire for adults and subsequent sections. The 2020 adult depression measures shown in the 2020 detailed tables (CBHSQ, 2021b) and 2020 first findings report (SAMHSA, 2021) were created using the combined Quarter 1 and 4 data and an adjusted analysis weight (“break-off adjusted analysis weight”). All 2020 youth depression estimates in the detailed tables were created using the standard analysis weight because the adjusted weight only impacted adult respondents. Due to potential disclosure risk, the break-off analysis weight was removed from the 2020 public use file (PUF). Therefore, all adult and youth depression measures analyzed using the 2020 PUF should use the standard analysis weight (ANAWLTQ1Q4\_C) and the variance estimation variables (VESTRQ1Q4\_C and VEREP). Because of this, caution should be used when analyzing the outcomes from the adult depression section and drawing conclusions using the PUF analysis weights. See Section 2.3.4 of the 2020 methodological summary and definitions (CBHSQ, 2021a) for more details on the weights used in the 2020 detailed tables and the first findings report.

Information on how to weight the depression data across survey years, including 2020, is provided below to explain how the adult and youth depression estimates were created as seen in the multiyear trend analyses published in the 2020 detailed tables (CBHSQ, 2021b). As previously described, the 2020 NSDUH underwent major methodological changes due to COVID-19. Given the differences in data collection periods and other methodological changes to procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from applicable prior years in the 2020 detailed tables. Comparisons of 2020 data with prior year NSDUH data should be done taking these changes into consideration.

Analyses on unadjusted 2008 data that include only adults from the WHODAS half-sample (subset to MHSAMP08=1), such as the 2008 adult MDE analyses in the 2008 detailed tables (OAS, 2009a) or in the 2009 mental health detailed tables (CBHSQ, 2010a), should be weighted by an alternate analysis weight (MHSAWT\_C). (Note that 2008 analyses including only adults from the SDS half-sample [subset to MHSAMP08=2] should also be weighted by MHSAWT\_C.) This weight has been poststratified so that each of the half-samples is separately representative of the civilian, noninstitutionalized population aged 18 or older. Generating 2008 adult MDE estimates using the entire unadjusted adult sample (both WHODAS and SDS half-samples) is not recommended. To compare or combine 2008 unadjusted adult MDE (using only the WHODAS subsample) and 2009-2020 adult MDE data, users should create a new weight variable that takes on the value of MHSAWT\_C for 2008 respondents, the value of ANALWT\_C for 2009-2019, and the value of ANALWTQ1Q4\_C for 2020 adult respondents. When doing this, users should restrict the unadjusted 2008 data to MHSAMP08=1 because the 2009-2020 NSDUHs use the same WHODAS questions as the 2008 WHODAS half-sample. For MDE analyses for the adult sample (i.e., 2009 through 2020), such as the MDE with severe impairment multiyear trend analyses in the 2020 detailed tables (CBHSQ, 2021b), users should also create a new weight variable that takes on the value of ANALWT\_C for 2009-2019 and the value of ANALWTQ1Q4\_C for 2020. The standard analysis weight (ANALWT\_C for years

---

<sup>13</sup> For information on criteria for identifying usable interviews, see Section 2.3.1 of the 2020 methodological summary and definitions for more details (CBHSQ, 2021a).

prior to 2020 and ANALWTQ1Q4\_C for 2020) should be used for MDE analyses for the entire youth sample. Users should also create a new variance estimation stratum variable that takes on the value of VESTR for 2009-2019 respondents and the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2009-2020.

To analyze the 2005-2008 adjusted adult MDE variables in conjunction with the 2009-2020 adult MDE variables (e.g., the MDE multiyear trend analyses published in the 2020 detailed tables [CBHSQ, 2021b]), the standard analysis weight should be used: ANALWT\_C for 2005 through 2019 and ANALWTQ1Q4\_C for 2020. Users should also create a new variance estimation stratum variable that takes on the value of VESTR for 2005-2019 respondents and the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2005-2020.

## **Appendix G**

### **Key Mental Health Variables**

## **G.1 Introduction**

This Key Mental Health Variables appendix provides several tables that list a set of the most commonly used mental health measures, their associated variable names, and their availability from 2002 to 2020 for the National Survey on Drug Use and Health (NSDUH).

[Table G.1](#) lists key mental health measures for youths aged 12 to 17, [Table G.2](#) lists key mental health measures for adults aged 18 or older, and [Table G.3](#) lists the mental health measures that have adjusted versions that allow for the comparisons of estimates across the years where changes were made. This appendix is being provided as a guide in helping data users with these commonly used mental health variables.

## **G.2 Impact of Coronavirus Disease 2019 on the 2020 NSDUH**

The coronavirus disease 2019 (COVID-19) pandemic made 2020 a unique year within the history of NSDUH. Quarter 1 (January to March 2020) was completed using standard NSDUH protocols with in-person data collection. However, Quarter 1 data collection ended 15 days early when work was suspended on March 16, 2020. Except for a very brief data collection effort that tested increased safety measures in July, no data were collected in Quarters 2 and 3 (i.e., April to September). For weighting, imputation, and estimation, the small number of Quarter 3 (i.e., July data) interviews were grouped with the Quarter 4 data. Data collection resumed in Quarter 4 but used in-person and web-based procedures. For simplicity, references of Quarter 4 in the 2020 detailed tables (Center for Behavioral Health Statistics and Quality [CBHSQ], 2021a), refers to the combined Quarters 3 and 4 data. The Substance Abuse and Mental Health Services Administration (SAMHSA) decided to produce estimates for 2020 using the combined data, when available, to increase the sample sizes and resulting precision of the estimates. To protect respondents' confidentiality, the variable QUARTER was removed from the file so that no quarterly analyses can be generated. For the mental health measures where the content did not change between Quarters 1 and 4, no changes were needed for the mental health variables because the questions in 2020 were equivalent to those in 2019. For some measures, content changes were made between Quarters 1 and 4, so adjustments were needed to combine the data.

Given the differences in data collection periods and other methodological procedures between 2020 and prior NSDUH years, SAMHSA decided not to make statistical comparisons between 2020 estimates and those from prior years in the 2020 detailed tables (CBHSQ, 2021a) and 2020 first findings report (SAMHSA, 2021). Due to methodological changes for 2020, caution is advised when comparing 2020 and prior years. Caution should also be used when attempting to distinguish the effects on estimates due to true changes<sup>1</sup> in the population (e.g., COVID-19, other events) from the effects due to methodological changes. Caveats regarding the 2020 data are provided throughout this appendix, where applicable. See Chapters 2, 3, and 6 of the 2020 methodological summary and definitions for details (CBHSQ, 2021b).

---

<sup>1</sup> A true change in a population survey estimate across years is a change that is not plausibly explained in survey data collection methods between those years.

### **G.3 Use of the Appendix Tables**

A summary of select youth and adult mental health variables and their comparability from 2002 to 2020 is presented in [Tables G.1](#) and [G.2](#). Notes under the tables explain changes in comparability across years. For the 2020 column, any variable names that are unchanged and are defined similarly for both Quarters 1 and 4 of 2020 are noted with an italicized “X.” The italics indicate that comparability is unknown and caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years. Italics are similarly used for the 2020 estimates when they are presented beside estimates from prior survey years in the 2020 detailed tables (CBHSQ, 2021a) and 2020 first findings report (SAMHSA, 2021).

For mental health measures where changes were made that have adjusted versions to allow for the comparisons of estimates across the years, [Table G.3](#) shows the variable names from 2002 to 2020, with the 2020 variable names in italics to indicate that comparability is unknown. To compare data across years, the variables would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software.

As noted above, this appendix only contains a subset of the mental health variables available. Groups of variables that are defined similarly may not all be included in the tables below. Examples of these groups are the variables for location of outpatient mental health treatment and the reason for not receiving mental health treatment, which are listed in [Table G.2](#). The variables for location where outpatient mental health treatment was received such as at a day hospital or treatment program (MHLDTMT3), at a school setting (MHL SCHL3), and other locations (MHLOTH3) are not specifically listed in [Table G.2](#) but are defined similarly to the variable for received outpatient mental health treatment from private therapist (MHL THER3) and follow the same pattern of comparability. The variables for reasons for not receiving mental health treatment including fear of negative affect on job (MHRJOBS2), insurance does not cover treatment at all (MHRNCOV2), have no transportation to treatment or inconvenient (MHRTRAN2), and did not want others to find out (MHRFOUT2) are also not listed in [Table G.2](#) but follow the same comparability pattern as the variable for reason for not receiving mental health treatment because could not afford cost (MHRCOST2). This appendix is intended to be a guide to assist public use file (PUF) users in identifying key mental health measures and does not include a full list of all mental health measures that are available.

### **G.4 Changes over Time**

There have been several mental health-related questionnaire and estimation changes that impact the comparability of mental health data over time. One such change made to the 2004 and 2008 questionnaires affected the mental health measures of serious psychological distress (SPD) and lifetime and past year major depressive episode (MDE). These changes resulted in noncomparable measures that caused breaks in the trends. Adjusted measures were created that allowed comparisons of estimates across the years<sup>2</sup> where the changes were made. See specifics in [Table G.3](#) and refer to Aldworth et al. (2012) for details on the adjusted measures, the

---

<sup>2</sup> Caution is advised when comparing 2020 with prior years due to methodological changes for 2020. See Chapter 6 of the 2020 methodological summary and definitions for details (CBHSQ, 2021b).

Recoded Depression Variable Documentation codebook appendix for MDE details, and the Recoded Mental Health codebook appendix for SPD details.

The NSDUH operational definition of serious mental illness (SMI) has also undergone some changes. In previously published 2002-2003 NSDUH reports, the K6 scale used for determining psychological distress was used to produce estimates that were termed “SMI,” but in 2004, the estimate produced using the K6 was renamed “SPD.” Starting in 2008, a new measure of SMI was produced that used a statistical model to predict mental illness based on a respondent’s answers to the NSDUH K6 and World Health Organization Disability Assessment Schedule (WHODAS) questions. For more details on this new SMI measure, see Appendix B, Section B.4.3, in the 2009 mental health findings report (CBHSQ, 2010). This model was revised to produce improved mental illness estimates starting with the 2012 NSDUH. This updated 2012 model was then used to create revised comparable mental illness estimates for 2008 through 2011. For details on these mental illness revisions, see Appendix B, Section B.4.3, in the 2012 mental health findings report (CBHSQ, 2013). Because of this change, mental illness variables based on the 2012 model have been created for 2008 and later years.<sup>3</sup> A measure of SMI was created for the 2005-2007 NSDUHs based on an alternative predictive model for a methodological report (CBHSQ, 2017). This exploratory SMI measure was developed in an attempt to be comparable with SMI variables for 2008 and later<sup>4</sup> NSDUHs; however, it is based on a different set of predictors. Users should consider the differences in methodology prior to making decisions on whether and how to use the SMI measure. For more information on how mental illness variables were created and how to use these variables, see the Recoded Mental Health codebook appendix.

As shown in [Tables G.1](#) and [G.2](#), mental health measures such as MDE and mental illness are combined with substance use disorder (SUD) measures. Starting with the 2020 NSDUH, the SUD variables used in the 2020 detailed tables were based on the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013). In prior years, the SUD estimates were based on the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994); therefore, all the 2020 SUD variables based on DSM-5 criteria are not considered comparable with prior years’ variables. The youth MDE and SUD combination variables listed in [Table G.1](#) and the adult mental illness and SUD combination variables listed in [Table G.2](#) are not comparable with the corresponding variables from prior years. See the Nicotine Dependence and Substance Use Disorder codebook appendix for more details on the 2020 changes to the SUD variables.

Another 2020 NSDUH change that started in Quarter 4 included revisions to the skip logic for the adult suicide questions asked in the mental health section of the codebook. The adult suicide estimates presented in the 2020 detailed tables (CBHSQ, 2021a) using the combined Quarters 1 and 4 data are produced using variables that were adjusted to match prior years’ skip logic. See the Recoded Mental Health codebook appendix for more information on the adult suicide variables.

<sup>4</sup> See footnote 1.

## G.5 Analysis Weight and Variance Estimates Variables

For the 2020 NSDUH, the weighting process was modified to account for the disruption in data collection due to COVID-19 and the subsequent introduction of multimode data collection (in person and web) for NSDUH in Quarter 4. See Section 2.3.4.2 of the 2020 methodological summary and definitions (CBHSQ, 2021b) for details on the modifications. One of the modifications had to do with the number of adult web respondents in Quarter 4 who provided usable information on their substance use but did not complete the mental health or later sections (i.e., “break-offs”), which raised concerns about the 2020 mental health estimates for adults and potential bias.<sup>5</sup> To overcome the bias issue, additional analysis weights (“break-off adjusted analysis weights”) were created to analyze unimputed outcome variables, beginning with the mental health section of the questionnaire for adults and including subsequent sections.

Due to potential disclosure risks, the break-off analysis weights were removed from the PUF. Because of this, caution should be used when analyzing the outcomes in the mental health and subsequent sections of the codebook and when drawing conclusions using the PUF analysis weights. To analyze the 2020 combined Quarters 1 and 4 data, the adult and youth mental health measures shown in [Tables G.1](#) to [G.3](#) should use the standard analysis weight (ANALWTQ1Q4\_C) and the variance estimation variables (VESTRQ1Q4\_C and VEREP). If combining 2020 with prior years of NSDUH data, the standard analysis weight variable names and variance estimation variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software.

---

<sup>5</sup> For information on criteria for identifying usable interviews, see Section 2.3.1 of the 2020 methodological summary and definitions for more details (CBHSQ, 2021b).

Past Year MDE with Severe Impairment and Alcohol Use Disorder (YMDEIMAUD, YMDEIMAD5YR) <sup>7</sup>														—	X
Past Year MDE with Severe Impairment and Substance Use Disorder (YMDEIMUDPY, YMDEIMSD5YR) <sup>7</sup>														—	X

MD = medical doctor, MDE = major depressive episode, MH = mental health.

NOTE: The letter X indicates that the measure is available for the year(s) shown. For 2020, “X” is italicized to indicate unknown comparability of 2020 with prior years. For 2020 measures with the same variable names as past years, caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years due to comparability of the data being unknown. For measures with two variable names listed, the first name corresponds with either the asterisk (\*) or the en dash (–) and the second name corresponds to the letter X in the years available columns. An asterisk (\*) indicates that a comparable measure with 2008 and later years is available for the year(s) shown; thus, variables corresponding to those measures in the indicated years can be renamed to conduct analyses with the 2008 and later year variables. An en dash (–) indicates that a comparable measure with later years is **not** available; thus, variables corresponding to those measures should not be compared across breaks in comparability (i.e., do not compare those measures with an en dash (–) with those measures with the letter X). An empty cell indicates that the measure is not available.

NOTE: This table lists only the most commonly used youth mental health measures; it does not constitute a comprehensive list.

NOTE: The standard analysis weight, ANALWT\_C, should be used for all youth measures and years up through 2019. For 2020, the weight was renamed ANALWTQ1Q4\_C because data were not collected for the full year. If combining 2020 data with data from prior years, the weight variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software.

NOTE: This table was finalized on October 6, 2021.

<sup>1</sup> These variables were created for years prior to 2010 during the 2014 NSDUH and are comparable with 2010 and later variables.

<sup>2</sup> Revised mental health service variables were developed starting in 2013 because of the change in how the child welfare setting was defined. Prior to 2013, child welfare was defined in the specialty services category as an inpatient service. Child welfare is now defined as a nonspecialty service. Starting in 2017, updates were made to classify certain patterns of responses into the reason not indicated category instead of the unknown category. Due to the small impact, these variables are considered comparable and were not renamed.

<sup>3</sup> A similarly named measure (without the “2”) exist for years 2002 through 2013 but are no longer being created starting with the 2014 NSDUH.

<sup>4</sup> For measures with two variable names listed, the second-named variables include the 2013 change in how the child welfare setting was defined. The original measures (first-named variables) are no longer being created starting with the 2013 NSDUH but are instead replaced with the revised variables.

<sup>5</sup> Both versions of these mental health service variables exist for the 2012 NSDUH because 2012 and 2013 estimates are presented in the 2013 mental health detailed tables (Center for Behavioral Health Statistics and Quality, 2014). The first- and second-named variables are **not** comparable for 2012.

<sup>6</sup> These variables were created during the 2015 NSDUH. Note that these were not included in data files for years prior to 2015 due to substance treatment at a specialty facility not being comparable as a result of the 2015 questionnaire changes.

<sup>7</sup> The variable names listed second were created starting with the 2020 NSDUH using the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013), to define substance use disorder. Therefore, these 2020 combination variables are not comparable with the 2015-2019 variables listed first which used SUD based on the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994).

G12

## Table G.2 Key Mental Health Measures for People Aged 18 or Older: 2002-2020 (continued)

K6 = six-item nonspecific psychological distress scale, MD = medical doctor, MDE = major depressive episode, MH = mental health, WHODAS = abbreviated eight-item World Health Organization Disability Assessment Schedule.

NOTE: The letter X indicates that the measure is available for the year(s) shown. For 2020, “X” is italicized to indicate unknown comparability of 2020 with prior years. For 2020 measures with the same variable names as past years, caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years due to comparability of the data being unknown. For measures with two variable names listed, the first name corresponds with either the asterisk (\*) or the en dash (–) and the second name corresponds to the letter X in the years available columns. An asterisk (\*) indicates that a comparable measure with later years is available for the year(s) shown; thus, variables corresponding to those measures in the indicated years can be renamed to conduct analyses with the later year variables. An en dash (–) indicates that a comparable measure with later years is **not** available; thus, variables corresponding to those measures should not be compared across breaks in comparability (i.e., do not compare those measures with an en dash (–) with those measures with the letter X). An empty cell indicates that the measure is not available.

NOTE: This table lists only the most commonly used adult mental health measures; it does not constitute a comprehensive list.

NOTE: The standard analysis weight, ANALWT\_C, should be used for all adult measures and years up through 2019. For estimating 2020 combined Quarters 1 and 4 data, the standard weight was renamed ANALWTQ1Q4\_C because data were not collected for the full year. If combining 2020 data with data from prior years, the weight variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. This use of the weights applies to all adult measures unless otherwise noted with footnote 1.

NOTE: This table was finalized on October 6, 2021.

<sup>1</sup> To compare the 2008 data with the 2009 or subsequent years, the 2008 mental health half-sample analysis weight, MHSAWT\_C, should be used in conjunction with the sample indicator (MHSAMP08=1) to subset to the 2008 WHODAS half-sample data.

<sup>2</sup> Starting with the 2017 NSDUH, the variable AMHOUTP3 was revised to define the logically assigned Yes level of having received outpatient mental health treatment/counseling in the past year as a system missing. The 2010-2016 NSDUHs originally had the logically assigned Yes level as a positive response as long as the respondent did not indicate an alternative source or invalid outpatient location as their only outpatient treatment location. The original version was renamed AMHOUTP3\_O and will be available on 2010-2016 data files along with the revised version, AMHOUTP3.

<sup>3</sup> Two versions of these variables exist for years 2002 through 2008. The original variables that end with a “2” have respondents who reported receiving no outpatient mental health coded as SAS® missing. The revised variables that end with a “3” have respondents who reported receiving no outpatient mental health coded as a “No” response. The two versions are not comparable.

<sup>4</sup> These variables were created during the 2015 NSDUH. Note that these are not comparable for years prior to 2015 due to substance treatment at a specialty facility not being comparable as a result of the 2015 questionnaire changes.

<sup>5</sup> These MH measures were excluded from the file due to disclosure risk.

<sup>6</sup> The variables SMIPP\_A and SMIYR\_A were created for the 2005-2007 NSDUHs based on an alternative predictive model for a methodological report (Center for Behavioral Health Statistics and Quality, 2017). These exploratory variables were developed in an attempt to be comparable with SMI variables for 2008 and later NSDUHs; however, they are based on a different set of predictors. Users should consider the differences in methodology prior to making decisions on whether and how to use the SMI measure. For information on the creation of the mental illness variables, see the Recoded Mental Health codebook appendix.

<sup>7</sup> SMIPP (a variable included in previous versions of the 2008-2011 data files) is based on the 2008 prediction model and SMIPP\_U is based on the 2012 prediction model. Mental illness variables originally created from SMIPP have been replaced with similarly named variables based on SMIPP\_U. For information on the creation of the mental illness variables, see the Recoded Mental Health codebook appendix.

<sup>8</sup> Mental illness variables based on the 2012 prediction model have been created from 2008 and later years. For years 2008-2011, these revised variables have replaced the previously available mental illness variables. See the Recoded Mental Health codebook appendix for further details about these revised mental illness variables.

<sup>9</sup> The 2008 and later years mental illness variables based on the 2012 prediction model and the 2005-2007 SMI variables based on an alternative model should not be used when analyzing variables for past year suicidal thoughts, past year MDE, the K6, or the WHODAS, nor should they be used when analyzing other variables closely linked with these variables (including past year suicide attempts, suicide plans, medical treatment for suicide attempts, lifetime MDE, serious psychological distress, or components used in the K6 or WHODAS scales). For more details, see the Recoded Mental Health codebook appendix.

<sup>10</sup> Mild or Moderate Mental Illness is referred to as “AMI Excluding SMI” in the detailed tables.

<sup>11</sup> The variable names listed second were created starting with the 2020 NSDUH using the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (DSM-5; American Psychiatric Association, 2013), to define substance use disorder. Therefore, these 2020 combination variables are not comparable with the 2015-2019 variables that were based on the criteria from the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV; American Psychiatric Association, 1994).

Source: SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health, 2002-2020.

**Table G.3 Comparable Versions of Key Mental Health Measures for People Aged 18 or Older: 2002-2020**

Mental Health Measure	Years Available					
	2002-2003	2004	2005-2007	2008	2009-2019	2020
Lifetime Major Depressive Episode			AJAMDELT	AJAMDELT	AMDELT	<i>AMDELT</i>
Past Year Major Depressive Episode			AJAMDEYR	AJAMDEYR	AMDEYR	<i>AMDEYR</i>
K6 Total Score in Worst Month of Past Year Based on Long Form Module	SMI_SUM	SPD_ASCR				
K6 Total Score in Worst Month of Past Year Based on Short Form Module		SPD_RSCR	SPD_USCR			
Worst K6 Total Score in Past Year <sup>1</sup>			K6SMXADJ	K6SCMAX	K6SCMAX	<i>K6SCMAX</i>
Past Year Serious Psychological Distress Indicator Based on Long Form Module	SMI	SPD_ADJ, SPD_UADJ <sup>2</sup>				
Past Year Serious Psychological Distress Indicator Based on Short Form Module		SPD_RADJ	SPD_UADJ			
Past Year Serious Psychological Distress Indicator Based on Worst K6 Total Score			SPDYRADJ	SPDYR	SPDYR	<i>SPDYR</i>

K6 = six-item nonspecific psychological distress scale.

NOTE: All variables within a row are comparable across the years indicated, even if they have different names. For 2020, the variable names are the same but shown in italics to indicate that caution is advised about making direct comparisons between estimates in 2020 and those from prior survey years due to comparability of the data being unknown.

NOTE: The standard analysis weight, ANALWT\_C, should be used for all adult measures and years up through 2019. For estimating 2020 combined Quarters 1 and 4 data, the standard weight was renamed ANALWTQ1Q4\_C because data were not collected for the full year. If combining 2020 data with data from prior years, the weight variable names would need to be renamed to be consistent across years before running analyses on the combined dataset using statistical software. This use of these weights applies as described for all adult measures unless otherwise noted in footnote 2.

NOTE: This table lists only the adult mental health measures with adjusted versions for comparability across years.

NOTE: In the 2002 and 2003 NSDUHs, serious psychological distress was referred to as serious mental illness.

NOTE: This table was finalized on October 6, 2021.

<sup>1</sup> Worst K6 Total Score in Past Year is the maximum of K6 Total Score in Past Month (K6SCMON) and K6 Total Score in Worst Month of Past Year (K6SCYR).

<sup>2</sup> SPD\_UADJ, restricted to the 2004 Sample A (Long Form), was used in the 2004 NSDUH detailed tables (Office of Applied Studies, 2005). SPD\_ADJ was created so that comparisons of serious psychological distress based on the long form can be made between 2002, 2003, and the full 2004 sample. The standard analysis weight, ANALWT\_C, should be used for SPD\_ADJ, but for SPD\_UADJ in 2004, the Sample A analysis weight, SPDWGHT\_C, should be used in conjunction with the sample indicator that subsets to the 2004 Sample A data (ADLTSAMP=1).

## **Appendix H**

### **Sample SUDAAN®, SAS®, and Stata Code and Public Use File Estimates**

## H.1 Introduction

This appendix provides several examples of SUDAAN® (and sometimes SAS® and Stata) code for generating estimates (means and totals along with the standard errors [SEs]), performing statistical tests of differences for means, calculating confidence intervals, and fitting linear or logistic regression models. Additionally, tables showing some estimates for alcohol use, tobacco product use, and serious mental illness (SMI) are included, using the 2020 National Survey on Drug Use and Health (NSDUH) public use file (PUF). PUF users can ensure that the 2020 PUF data are downloaded correctly, or that code is implemented correctly, by replicating estimates in these tables. Note that the examples in this appendix are created using variable names and data from the NSDUH PUF; thus, some variable names may differ when using the NSDUH restricted-use file (RUF). Also note that the estimates in these tables may differ from the estimates in the *Results from the 2020 National Survey on Drug Use and Health: Detailed Tables* at <https://www.samhsa.gov/data/>, which are based on RUF data. The exhibit number for each example and a description of the example are provided in [Table H.1](#).

**Table H.1 Summary of SUDAAN®, Stata, and SAS® Exhibits**

SUDAAN Exhibit	Stata Exhibit	SAS Exhibit	Description
<a href="#">H.1</a>	<a href="#">H.2</a>	<a href="#">H.3</a>	Produces estimates (including means, totals, and the respective standard errors)
<a href="#">H.4</a>	<a href="#">H.5</a>	<a href="#">H.6</a>	Calculates the standard errors of totals produced in <a href="#">Exhibits H.1</a> to <a href="#">H.3</a> for domains forced to match their respective U.S. Census Bureau population estimates through poststratification during the weighting process
<a href="#">H.7</a>			Performs statistical tests of differences between means
<a href="#">H.8</a>			Calculates a confidence interval using estimates produced in <a href="#">Exhibit H.1</a>
<a href="#">H.9</a>			Calculates percentages and the associated standard errors
<a href="#">H.10</a>			Performs logistic regression (for binary response variables)
<a href="#">H.11</a>			Performs regression analysis (for continuous response variables)

NOTE: An empty cell indicates that no SAS or Stata example is provided for that specific topic.

## H.2 Guide for Defining Options for Analyzing NSDUH Data

Before running SUDAAN procedures, the input dataset must be sorted by the nesting variables (VESTRQ1Q4\_C and VEREP),<sup>1</sup> or the NOTSORTED option must be used for SUDAAN to create an internal copy of the input dataset properly sorted by the nesting variables. The SUDAAN procedure DESCRIPT can then be run to produce unweighted sample sizes and weighted (using ANALWTQ1Q4\_C for the 2020 PUF or a pooled weight created for calculating annual averages) sample sizes, means, totals, SEs of means and totals, and *p* values for testing the differences between means and totals. Note for years 2019 and prior, the sample design stratum variable and PUF analysis weight variable are named VESTR and ANALWT\_C, respectively. When pooled analysis is performed, users should create a new analysis weight variable that takes on the value of the analysis weight ANALWT\_C for 2019 or prior and the value of the analysis weight ANALWTQ1Q4\_C for 2020 respondents. Users should also create a new variance estimation stratum variable that takes on the value of VESTR for 2019 or prior and

<sup>1</sup> VESTRQ1Q4\_C = variance estimation (pseudo) stratum, and VEREP = variance estimation (pseudo) replicate within stratum.

the value of VESTRQ1Q4\_C for 2020 respondents. The variance estimation primary sampling unit within stratum variable VEREP is named the same for all years 2002 to 2020. For more information on using appropriate weights when producing annual averages of combined years of data, see the Special Types of Analyses section of the 2020 PUF codebook introduction at <https://datafiles.samhsa.gov/>. As noted in that section, data users should exercise caution when comparing estimates involving 2020 with estimates not involving 2020 data because, given the methodological changes that occurred in 2020, the independent reasons for differences in estimates from 2020 and prior years cannot be determined conclusively.

The SAS procedure SURVEYMEANS is used in [Exhibit H.3](#) (shown grouped with [Exhibits H.1](#) and [H.2](#) later in this appendix). Note that SAS also uses VESTRQ1Q4\_C and VEREP as nesting variables; however, as previously noted, the data do not need to be sorted.

The options described in the following sections are specified within the SUDAAN and SAS examples to correctly produce estimates using NSDUH data. Stata and SAS commands can be run without the data being sorted; however, it should be noted that Stata code is case sensitive.

### H.3 Design

Because of NSDUH's complex sample design, estimates are calculated using a method in SUDAAN that is unbiased for linear statistics. This method is based on multistage clustered sample designs where the first-stage (primary) sampling units are drawn with replacement. In SUDAAN, a user must specify DESIGN=WR (meaning with replacement). Note that with Stata and SAS, the design does not need to be indicated because the svyset command in Stata and the SURVEYMEANS procedure in SAS use Taylor linearized variance estimation as a default.

### H.4 Nesting Variables

The NSDUH nesting variables (VESTRQ1Q4\_C and VEREP) are used to capture explicit stratification and to identify clustering with the NSDUH data, which are needed to compute the variance estimates correctly. Two replicates per year were defined within each variance stratum (VESTRQ1Q4\_C). In SUDAAN, users must use the NEST statement within one of the appropriate SUDAAN procedures. In the NEST statement, the variance stratum variable should be listed first, followed by the primary sampling unit variable; that is, the VESTRQ1Q4\_C variable should be listed first, followed by the VEREP variable. In SAS, users must use the STRATA and CLUSTER statements within one of the appropriate SAS procedures. VESTRQ1Q4\_C should be listed in the STRATA statement, and VEREP should be listed in the CLUSTER statement. The NEST statement in SUDAAN and the STRATA and CLUSTER statements in SAS will need to be used each time one of the appropriate SUDAAN or SAS procedures are used, respectively. In Stata, the nesting variables are specified in the svyset command.

### H.5 Degrees of Freedom

The degrees of freedom (DDF in SUDAAN and dof in Stata) are 60 for the 2002 to 2013 NSDUH national estimates and 50 for the 2014 NSDUH and onward national estimates under the new sampling design established in the 2014 NSDUH. When combining any set of years of data (i.e., 2018 and 2019), the degrees of freedom remain the same as if the set were a single

year (e.g., 50 for national estimates) when these years are part of the same sample design. When combining a pair of years with different degrees of freedom (i.e., 2013 and 2014), the specific number of degrees of freedom can be computed by counting the unique values of VESTRQ1Q4\_C or VESTR. For example, when producing estimates by combining data for 2018 and 2019, DDF=50 can be used because the sample design remained the same across those 2 years. When combining data for 2013 and 2014, DDF=110 because the sample design changed in 2014.

When comparing estimates in two domains with different degrees of freedom, researchers should err on the conservative side and use the smaller degrees of freedom. For example, when comparing 2013 estimates with 2014 estimates, use DDF=50. For details about degrees of freedom, see Section 6 in the 2019 statistical inference report.<sup>2</sup> To specify the degrees of freedom in SUDAAN, the DDF = option on the procedure statement is used. This option should be used each time one of the appropriate SUDAAN procedures is used to ensure correct calculations. The provided SAS exhibits do not include testing or calculation of confidence intervals; therefore, options for specifying degrees of freedom are not shown. In Stata, the degrees of freedom are specified as a design option in the svyset command, "dof(50)."

## H.6 Design Effect

The option DEFT4 within SUDAAN provides the correct measure of variance inflation due to stratification (or blocking), clustering, and unequal weighting in NSDUH estimation. The design effect cannot be output directly from the SURVEYMEANS procedure in SAS.

## H.7 Examples of SUDAAN, SAS, and Stata Code

### H.7.1 Generation of Estimates

[Exhibits H.1](#), [H.2](#), and [H.3](#) demonstrate how to compute estimates for past month alcohol use by gender using (1) the SUDAAN DESCRIPT procedure, (2) the Stata svy: mean and svy: total commands, and (3) the SAS SURVEYMEANS procedure, respectively. The SUDAAN example includes code to compute the prevalence estimate (MEAN), SE of the mean (SEMEAN), weighted sample size (WSUM), unweighted sample size (NSUM), weighted total (TOTAL), and SE of the total (SETOTAL). The Stata svy: mean and svy: total commands and the SAS SURVEYMEANS procedure will produce the same estimates. Whether the SETOTAL is taken directly from SUDAAN or from Stata or SAS code depends on whether the specified domain (i.e., gender in this example) is among those forced to match their respective U.S. Census Bureau population estimates through the weight calibration process. For details about calculating the SE of totals, see the Variance Estimation of Estimated Numbers of Individuals section of the 2020 PUF codebook introduction at <https://datafiles.samhsa.gov/>. For examples of code to calculate the SEs of totals, see Section H.7.2 on Standard Errors of the Totals.

### **H.7.2 Standard Errors of the Totals**

The SE for the mean (or proportion) is obtained directly from SUDAAN and SAS in the output variables SEMEAN ([Exhibit H.1](#)) and STDERR ([Exhibit H.3](#)), respectively, and the SEMEAN is calculated in Stata by taking the square root of the variance ([Exhibit H.2](#)). However, to compute the SE of the totals, NSDUH implements different methods depending on whether the specified domain (i.e., gender in this example) is forced to match its respective U.S. Census Bureau population estimates through poststratification during the weighting process. For those domains that are free of sampling error, an alternative SE estimation method to using SUDAAN is applied to estimate the SE of the totals. In the Variance Estimation of Estimated Numbers of Individuals section of the 2020 PUF codebook introduction at <https://datafiles.samhsa.gov/>, [Table H.1](#) lists the demographic domains that use the alternative SE estimation method. For these domains (e.g., forced to match the U.S. Census Bureau population estimates), the SE of the total is calculated as SETOTAL (SE of controlled domain) = WSUM (weighted sample size) ×

SEMEAN (SE for the mean/proportion). For all other domains (e.g., those not forced to match the U.S. Census Bureau population estimates), the SE of the total is obtained directly from SUDAAN and SAS in the output variables SETOTAL and STDDEV, respectively. Because gender is one of the domains that uses the alternative SE estimation method, the SE of the totals would not be taken directly from the examples in [Exhibits H.1](#) through [H.3](#), but rather would be computed using the formula shown in [Exhibits H.4](#) through [H.6](#). Note that the formula is the same in [Exhibits H.4](#), [H.5](#), and [H.6](#). [Exhibit H.1](#) shows SUDAAN code, [Exhibits H.2](#) and [H.5](#) use Stata code, and [Exhibits H.3](#), [H.4](#), and [H.6](#) use SAS code.

#### **Exhibit H.4 SAS Code Based on SUDAAN Output (Calculation of Standard Error [SE] of Totals Using the Alternative SE Estimation Method)**

```

DATA ESTIMATE;
SET OUT.SUDFILE; /*input the output file from above SUDAAN procedure*/
/****************/
Define SETOTAL for gender because it is a domain forced to match its respective U.S. Census Bureau population estimates.
In the SUDAAN procedure in Exhibit A.1, IRSEX is in the subgroup Statement with 2 levels indicated. Therefore, values for 0=total males & females, 1=males, and 2=females are automatically produced.
/****************/
IF IRSEX IN (0,1,2) THEN SETOTAL=WSUM*SEMEAN;

RUN;

```

#### **Exhibit H.5 Stata Code Based on Stata Output (Calculation of Standard Error [SE] of Totals Using the Alternative SE Estimation Method)**

```

generate setotal2=wsum*semean
replace setotal = setotal2 if inlist(irsex,1,2)
/*Note, Stata does not automatically produce overall estimates, i.e., irsex=0*/

```

#### **Exhibit H.6 SAS Code Based on SAS Output (Calculation of Standard Error [SE] of Totals Using the Alternative SE Estimation Method)**

```

DATA SASEST;
SET OUT.SASFILE; /*input the output file from above SAS procedure */

IF IRSEX IN (1,2) THEN SETOTAL=SUMWGT*STDERR;
/*Note, SAS does not automatically produce overall estimates, i.e., irsex=0*/

RUN;

```

### H.7.3 Statistical Tests of Differences

Significance tests can be conducted on differences of prevalence estimates between two domains. For the SUDAAN example, testing of differences requires a separate PROC DESCRIPT run from the initial DESCRIPT run ([Exhibit H.1](#)) that produces the corresponding gender-specific estimates. Tests of differences can be generated using DESCRIPT's CONTRAST, PAIRWISE, or DIFFVAR statements. The SUDAAN example ([Exhibit H.7](#)) uses the DIFFVAR statement to test for differences of means between males and females of past month alcohol use estimates for all people aged 12 or older.

#### Exhibit H.7 SUDAAN DESCRIPT Procedure (Tests of Differences)

```
PROC DESCRIPT DATA=DATANAME DDF=50 DESIGN=WR FILETYPE=SAS;
/*Alternatively, the DDF may change if using data combined across several years*/
NEST VESTRQ1Q4_C VEREP;
WEIGHT ANALWTQ1Q4_C;
VAR ALCMON;
SUBGROUP IRSEX;
LEVELS 2;
DIFFVAR IRSEX=(1 2) / NAME="MALES vs FEMALES";
PRINT WSUM NSUM MEAN SEMEAN T_MEAN P_MEAN /
    REPLACE STYLE=NCHS;
OUTPUT WSUM MEAN SEMEAN NSUM T_MEAN P_MEAN /
    REPLACE
    NSUMFMT=F8.0 WSUMFMT=F12.0 MEANFMT=F15.10 SEMEANFMT=F15.10 FILENAME="OUT.SUDTESTS";
TITLE "TESTS OF DIFFERENCES IN ESTIMATES OF PAST MONTH ALCOHOL BETWEEN MALES AND
FEMALES";
RUN;
```

Note: The following CLASS statement could be used in place of SUBGROUP and LEVELS statements in the above examples:  
CLASS IRSEX;

When one or more contrasts are specified in SUDAAN, as in the DIFFVAR statement mentioned earlier, the output variable MEAN becomes the contrast mean where the number assigned to the output variable, CONTRAST, represents the tests in order of appearance in the SUDAAN code, and SEMEAN becomes the SE of the contrast mean. The examples provided earlier also output the *t*-statistic (T\_MEAN) and the corresponding *p* value (P\_MEAN).

### H.7.4 Confidence Intervals

Confidence intervals can be calculated using means (MEAN) and SEs (SEMEAN) from PROC DESCRIPT in SUDAAN. After the means and SEs are obtained ([Exhibit H.1](#)), the code in [Exhibit H.8](#) can be used to create the 95 percent confidence intervals for means and totals.

### **Exhibit H.8 SAS Code Based on SUDAAN Output (Calculating a 95 Percent Confidence Interval)**

```
DATA CI;
SET OUT.SUDFILE; /*output data from Exhibit A.1*/
T_QNTILE=TINV(0.975,50); /*define t-statistic*/
NUMBER=SEMEAN/(MEAN*(1-MEAN));
L=LOG(MEAN/(1-MEAN));

A=L-T_QNTILE*NUMBER;
B=L+T_QNTILE*NUMBER;

PLOWER=1/(1+EXP(-A));
PUPPER=1/(1+EXP(-B));
/*PLOWER AND PUPPER ARE THE 95% CIS ASSOCIATED WITH MEAN FROM SUDAAN*/
TLOWER=WSUM*PLOWER;
TUPPER=WSUM*PUPPER;
/*TLOWER AND TUPPER ARE THE 95% CIS ASSOCIATED WITH TOTAL FROM SUDAAN*/
RUN;
```

### **H.7.5 Calculating Percentages for Categories**

[Exhibit H.9](#) demonstrates how to compute estimates corresponding to levels of a categorical variable. This example uses the number of days that marijuana was used in the past month among past month marijuana users. The variable that will be analyzed (MRJDAY) is a categorical variable with days grouped into four levels (1 = 1-2 days, 2 = 3-5 days, 3 = 6-19 days, 4 = 20+ days). Because SUDAAN now needs to estimate percentages and SEs for each level of the variable instead of computing only one estimate for the variable overall, the CATLEVEL statement is introduced, and the PERCENT and SEPERCENT keywords replace the MEAN and SEMEAN keywords.

### **Exhibit H.9 SUDAAN DESCRIPT Procedure (Frequency of Use; i.e., Number of Days Used Substance in the Past Month among Past Month Users)**

```
PROC DESCRIPT DATA=DATANAME DDF=50 DESIGN=WR FILETYPE=SAS DEFT4;
/*Alternatively, the DDF may change if using data combined across several years*/
NEST VESTRQ1Q4_C VEREP;
WEIGHT ANALWTQ1Q4_C; /*Standard single-year, PUF person-level analysis weight*/
VAR MRJMDAYS MRJMDAYS MRJMDAYS MRJMDAYS; /*Marijuana Use frequency in the past month
variable: 1=1-2 days, 2=3-5 days, 3=6-19 days, 4=20+ days, 5=did not use marijuana in the
past month*/
CATLEVEL 1 2 3 4; /*levels of MRJMDAYS to be shown in table*/
SUBGROUP MRJMON;
/*Past month marijuana use variable, where used in past month=1 & did not use in past
month=0*/
LEVELS 1;
TABLES MRJMON; /*Tables will show percents among marijuana users*/
PRINT WSUM NSUM PERCENT SEPERCENT TOTAL SETOTAL / REPLACE STYLE=NCHS;
OUTPUT WSUM PERCENT SEPERCENT TOTAL SETOTAL NSUM / REPLACE FILENAME="OUT.SUDFILE_FREQ";
TITLE "FREQUENCY OF MARIJUANA USE BY PAST MONTH MARIJUANA USERS";
RUN;
```

## H.7.6 Regression Analysis

Multiple regression analysis can be implemented via PROC RLOGISTIC for logistic regression if the outcome is a binary variable or via PROC REGRESS for linear regression if the outcome is a continuous variable in SUDAAN to study the relationship between an outcome and several covariates. Parameters estimated will primarily include regression coefficients, SEs for beta coefficients, Wald chi-square test or *t*-test, *p* values, and odds ratios (for logistic regression only). [Exhibits H.10](#) and [H.11](#) demonstrate the SUDAAN syntax for such analyses using NSDUH PUF data. For details about regression analyses using SUDAAN, see the SUDAAN operations manual.<sup>3</sup>

### Exhibit H.10 SUDAAN RLOGIST Procedure

```
/*Association between alcohol past month use and demographic variables, recode IRMARIT=99 to
IRMARIT=5*/
PROC RLOGIST DATA=DATANAME DDF=50 DESIGN=WR FILETYPE=SAS;
/*Alternatively, the DDF may change if using data combined across several years*/

## **H.8 Examples of Selected 2020 PUF Tables**

Tables H.2, H.3, and H.4 on the following pages are examples of tables of estimates and SEs produced using the 2020 NSDUH PUF and are similar in format to the 2020 NSDUH detailed tables, which will be available online at <https://www.samhsa.gov/data/>.

**Table H.2 Alcohol Use, Binge Alcohol Use, and Heavy Alcohol Use in the Past Month: Among People Aged 12 or Older; by Demographic Characteristics, Percentages and Standard Errors, 2020 NSDUH Public Use File Estimates**

Demographic Characteristic	ALCOHOL USE		BINGE ALCOHOL USE		HEAVY ALCOHOL USE	
	Estimate	SE	Estimate	SE	Estimate	SE
<b>TOTAL</b>	49.5	0.53	21.7	0.45	6.2	0.23
<b>AGE</b>						
12-17	7.9	0.56	3.9	0.48	0.5	0.15
18-25	51.5	0.96	31.0	0.86	8.6	0.58
26 or Older	53.9	0.64	22.4	0.54	6.5	0.29
<b>GENDER</b>						
Male	51.9	0.74	24.2	0.66	8.0	0.42
Female	47.2	0.81	19.4	0.56	4.5	0.27
<b>HISPANIC ORIGIN AND RACE</b>						
Not Hispanic or Latino	51.0	0.61	21.4	0.45	6.4	0.23
White	54.7	0.71	22.4	0.51	7.0	0.28
Black or African American	44.3	1.67	20.8	1.24	5.3	0.71
American Indian or Alaska Native	32.5	5.56	17.3	3.89	7.0	2.83
Native Hawaiian or Other Pacific Islander	28.4	8.28	22.4	8.52	2.9	1.38
Asian	33.0	2.56	12.1	1.47	1.9	0.38
Two or More Races	41.2	3.16	21.1	3.03	7.2	1.73
Hispanic or Latino	42.2	1.60	23.5	1.40	5.3	0.65

PUF = public use file; SE = standard error that is associated with the PUF estimate.

NOTE: NSDUH PUFs are available for download at <https://datafiles.samhsa.gov/>.

NOTE: PUF estimates in this table might differ from the estimates in the "Tobacco Product and Alcohol Use" detailed tables available at <https://www.samhsa.gov/data/>, which are based on restricted-use data.

NOTE: Binge alcohol use is defined as drinking five or more drinks (for males) or four or more drinks (for females) on the same occasion (i.e., at the same time or within a couple of hours of each other) on at least 1 day in the past 30 days. In 2015, the definition for females changed from five to four drinks. Heavy alcohol use is defined as binge drinking on the same occasion on each of 5 or more days in the past 30 days; all heavy alcohol users are also binge alcohol users.

NOTE: No precision-based suppression rules have been applied to this table; users are encouraged to apply appropriate suppression rules as needed.

Source: SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health, Quarters 1 and 4, 2020.

**Table H.3 Tobacco Product Use in Lifetime, Past Year, and Past Month: Among People Aged 12 or Older; by Demographic Characteristics, Percentages and Standard Errors, 2020 NSDUH Public Use File Estimates**

Demographic Characteristic	LIFETIME		PAST YEAR		PAST MONTH	
	Estimate	SE	Estimate	SE	Estimate	SE
<b>TOTAL</b>	57.3	0.53	22.8	0.47	18.3	0.44
<b>GENDER</b>						
Male	63.9	0.73	27.9	0.74	22.3	0.67
Female	51.1	0.79	17.9	0.64	14.5	0.59
<b>HISPANIC ORIGIN AND RACE</b>						
Not Hispanic or Latino	59.8	0.54	23.9	0.51	19.4	0.52
White	65.2	0.63	24.6	0.61	19.6	0.58
Black or African American	47.8	1.55	25.1	1.25	21.3	1.24
American Indian or Alaska Native	64.0	5.83	44.8	6.02	39.1	5.97
Native Hawaiian or Other Pacific Islander	55.8	10.39	24.8	8.04	24.0	7.99
Asian	28.2	2.13	10.0	1.42	8.1	1.56
Two or More Races	59.7	3.07	30.2	2.64	26.4	2.52
Hispanic or Latino	45.3	1.50	17.4	0.92	13.1	0.87

PUF = public use file; SE = standard error that is associated with the PUF estimate.

NOTE: NSDUH PUFs are available for download at <https://datafiles.samhsa.gov/>.

NOTE: PUF estimates in this table might differ from the estimates in the "Tobacco Product and Alcohol Use" detailed tables available <https://www.samhsa.gov/data/>, at which are based on restricted-use data.

NOTE: Tobacco products include cigarettes, smokeless tobacco (i.e., snuff, dip, chewing tobacco, or snus), cigars, or pipe tobacco. Tobacco product use in the past year excludes past year pipe tobacco use but includes past month pipe tobacco use.

NOTE: No precision-based suppression rules have been applied to this table; users are encouraged to apply appropriate suppression rules as needed.

Source: SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health , Quarters 1 and 4, 2020.

**Table H.4 Serious Mental Illness in the Past Year: Among Adults Aged 18 or Older; by Age Group and Demographic Characteristics, Percentages and Standard Errors, 2020 NSDUH Public Use File Estimates**

Demographic Characteristic	TOTAL		AGED 18-25		AGED 26-49		AGED 50+	
	Estimate	SE	Estimate	SE	Estimate	SE	Estimate	SE
<b>TOTAL</b>	5.3	0.24	9.4	0.63	6.6	0.33	3.1	0.32
<b>GENDER</b>								
Male	4.0	0.30	6.3	0.62	5.1	0.44	2.3	0.47
Female	6.5	0.30	12.5	0.93	8.0	0.44	3.7	0.44
<b>HISPANIC ORIGIN AND RACE</b>								
Not Hispanic or Latino	5.6	0.25	10.1	0.77	7.1	0.34	3.2	0.37
White	6.0	0.31	12.0	0.88	8.2	0.46	3.2	0.41
Black or African American	4.4	0.77	3.6	0.74	4.5	0.82	4.6	1.64
American Indian or Alaska Native	7.2	2.95	8.5	5.24	9.2	4.74	3.5	3.50
Native Hawaiian or Other Pacific Islander	1.2	0.98	0.7	0.75	1.4	1.43	0.7	0.53
Asian	2.2	0.53	6.5	2.15	2.1	0.71	0.8	0.60
Two or More Races	8.6	1.83	15.4	4.39	9.8	2.25	3.0	2.45
Hispanic or Latino	4.2	0.44	6.7	1.07	4.6	0.61	2.1	0.52
<b>HEALTH INSURANCE<sup>1</sup></b>								
Private	4.3	0.24	10.3	0.82	5.1	0.32	2.1	0.33
Medicaid/CHIP <sup>2</sup>	8.0	0.56	9.3	1.18	11.2	1.01	3.3	1.05
Other <sup>3</sup>	4.4	0.52	7.9	2.28	12.5	2.04	3.3	0.53
No Coverage	5.6	0.69	6.6	1.11	6.1	0.90	3.5	1.38
<b>CURRENT EMPLOYMENT</b>								
Full-Time	4.3	0.25	9.4	0.99	4.9	0.32	1.6	0.31
Part-Time	7.1	0.60	9.7	0.89	8.9	1.03	3.6	1.05
Unemployed	8.2	1.17	12.5	2.07	7.9	1.81	4.3	2.42
Other <sup>4</sup>	5.6	0.43	7.8	0.98	10.4	0.97	3.8	0.55

PUF = public use file; SE = standard error that is associated with the PUF estimate.

NOTE: NSDUH PUFs are available for download at <https://datafiles.samhsa.gov/>.

NOTE: PUF estimates in this table might differ from the estimates in the "Adult Mental Health" detailed tables available at <https://www.samhsa.gov/data/>, which are based on restricted-use data.

NOTE: Serious mental illness (SMI) aligns with *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV), criteria and is defined as having a diagnosable mental, behavioral, or emotional disorder, other than a developmental or substance use disorder. Estimates of SMI are a subset of estimates of any mental illness (AMI) because SMI is limited to persons with AMI that resulted in serious functional impairment. These mental illness estimates are based on a predictive model and are not direct measures of diagnostic status.

NOTE: No precision-based suppression rules have been applied to this table; users are encouraged to apply appropriate suppression rules as needed.

<sup>1</sup> Respondents could indicate multiple types of health insurance; thus, these response categories are not mutually exclusive.

<sup>2</sup> CHIP is the Children's Health Insurance Program. Individuals aged 19 or younger are eligible for this plan.

<sup>3</sup> Other health insurance is defined as having Medicare, military-related health care, or any other type of health insurance.

<sup>4</sup> The other employment category includes students, persons keeping house or caring for children full time, retired or disabled persons, or other persons not in the labor force.
